Date: July 21, 2017

This paper on Safe Motion is a document as created by the PLCopen Technical Committee 5, TC5 - Safe Software.

It summarises the results of the Task Force Safe Motion and several meetings of PLCopen TC 5, containing contributions of all its members.

The present specification was written thanks to the following members:

Name	Company
Ulf Schuenemann	3S Smart Software Solutions
Engelbert Meier	Baumüller
Guido Beckmann	Beckhoff
Roland Wagner	B&R Automation
Andreas Hager	B&R Automation
Burchardt Hagen	Bosch Rexroth
Wolfgang Zeller	Hochschule Augsburg
Makoto Okuda	Kanagawa Research Institute
Karl Pickan	Kollmorgen
Michael Niehaus	Lenze
Josep Plassa	Omron
Takashi Matsukuma	Omron
Harry Koop	Phoenix Contact Software
Kevin Hull	Yaskawa
Eelco van der Wal	PLCopen

## Change Status List:

Version number	Date	Change comment
V 0.1	April 3, 2015	First version done by EvdW as result of several webmeetings
V 0.2	April 30, 2015	As result of feedback, the webmeeting on April 10, and further work
V 0.3	June 17, 2016	Added CC-Link and MECHATROLINK specification
V 0.31	July 14, 2016	First changes added E. Meier and decisions webmeeting July 11
V 0.32	August 30, 2016	As result of the webmeeting on Aug. 24 and additional feedback Ch. 4.5
V 0.99	September 26, 2016	As result of the webmeeting on Sept. 21
V 0.99A	January 25, 2017	As a result of feedback and the webmeetings on Dec.14 & Jan 25
V 0.99B	March 6, 2017	As result of the Face2Face meeting on Feb 21 & 22 at Bosch
V 1.0	July 21, 2017	Official release

## Introduction

The PLCopen Technical Committee 5, TC5, deals with software for safety environments with a focus to the operating personnel. The Committee has already published several specifications, like the Technical Specification Part 1: Concepts and Function Blocks Version 1.0 of January 31, 2006 as well as consecutive parts. Inside these published specifications the safety aspects around motion have been described only partially. This document fills this gap.

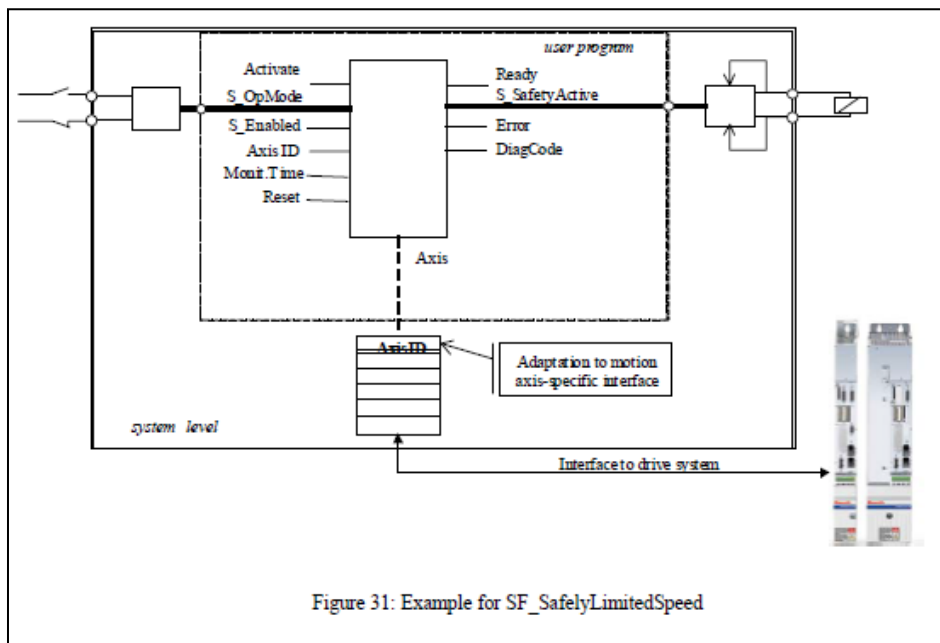

Figure 1: Example of Part 1 concerning Safety Limited Speed

## 1.1. Rationale

The emergence of (fast) digital networks made it possible to link many motors to a controller. In many cases servo technology replaces the large single motor solution, making the functionalities locally available in the machine and also replacing the previously mechanical solutions by software control. This solution is also referred to as “mechatronic solutions”.

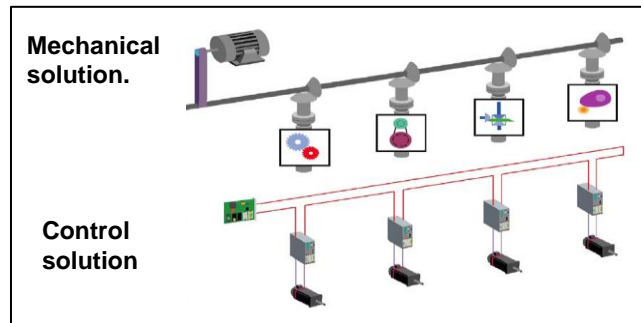

Figure 2: From mechanical to mechatronics

With multiple motors, the safety connections have changed also: from a hardwired safety solution to a solution over a safety network with a dedicated safety controller added to the functional controller (PLC).

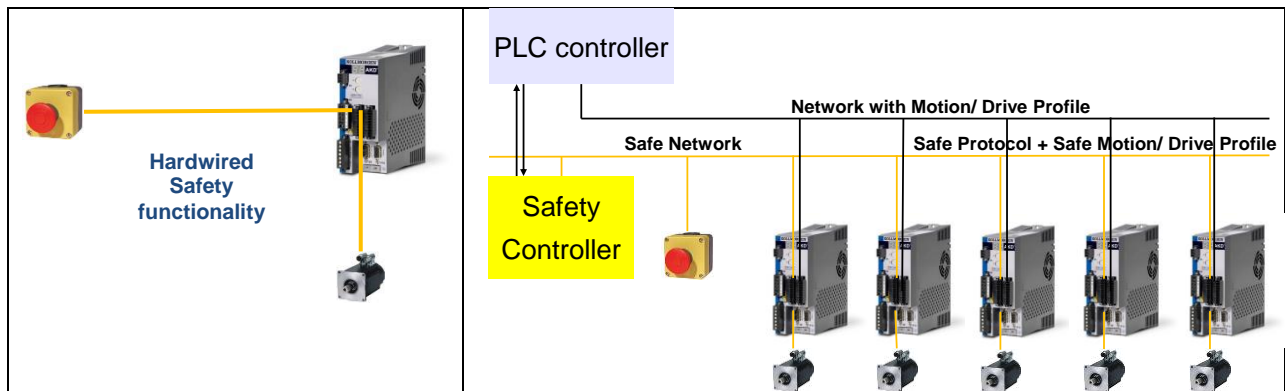

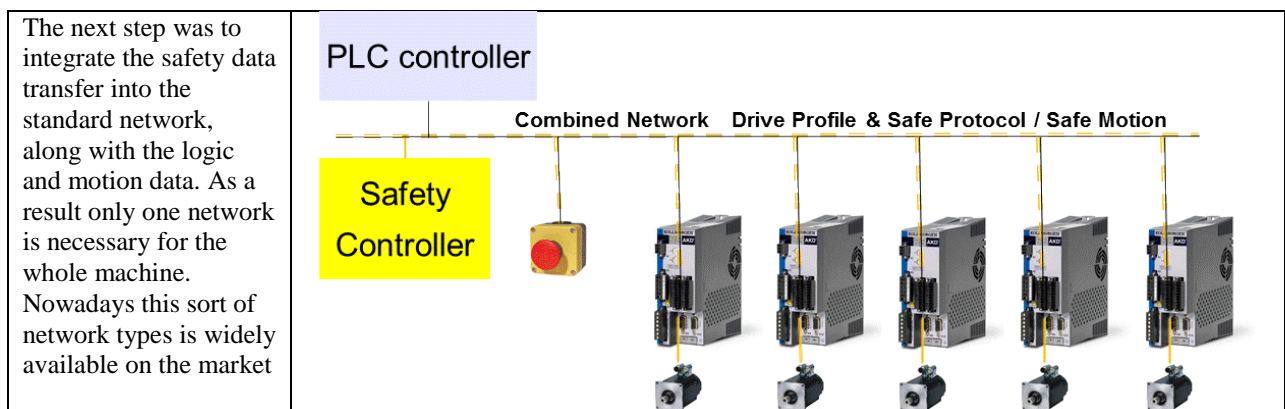

Figure 3: From hardwired to networked safety functionalities

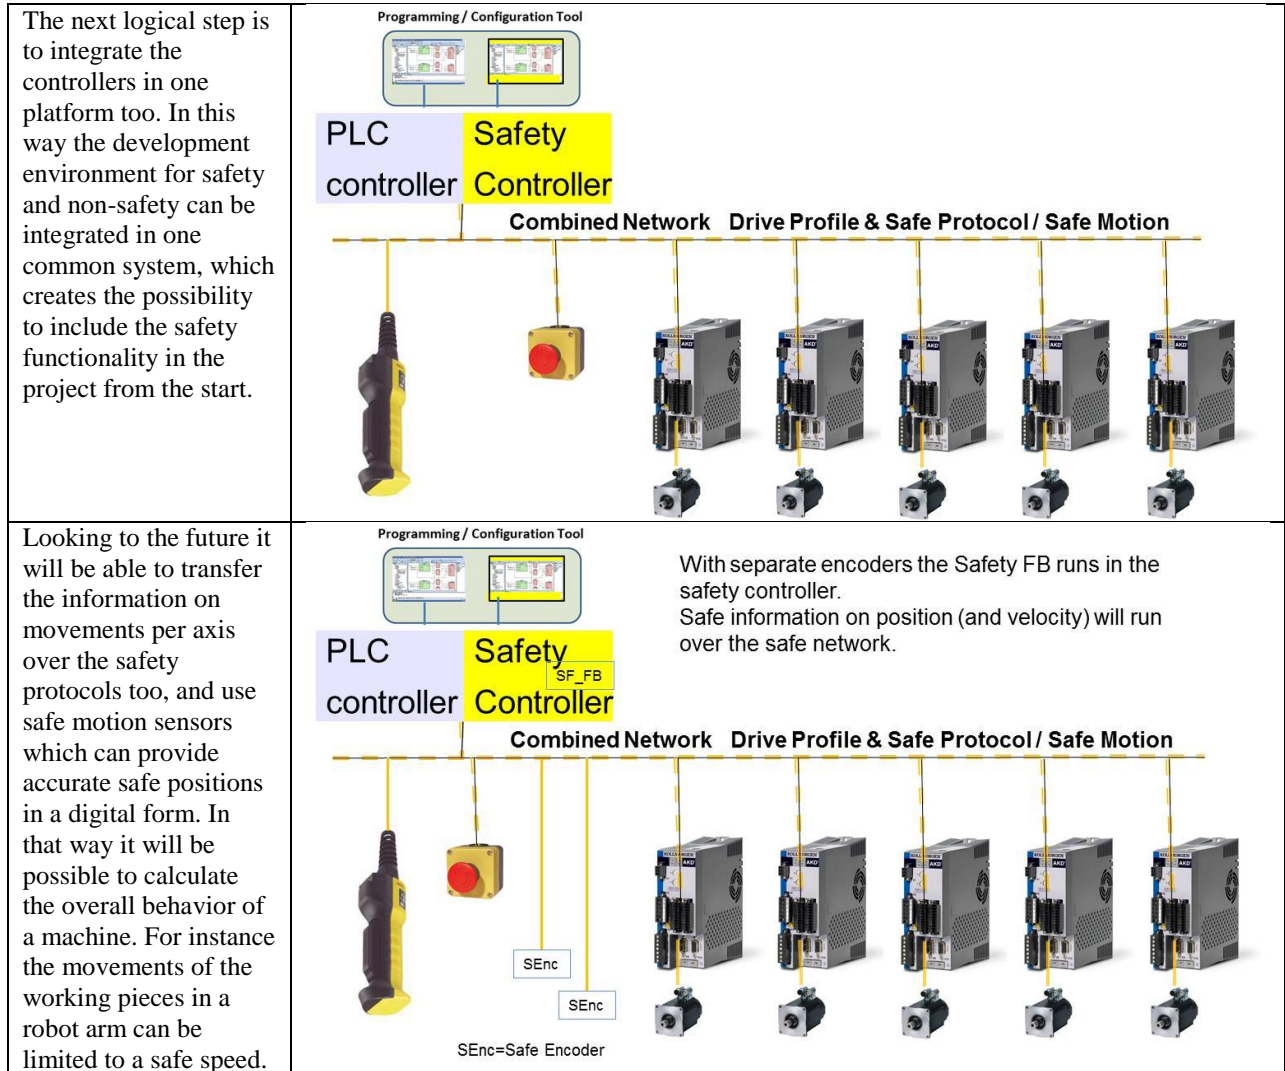

Figure 4: From hardwired to networked safety functionalities (cont.)

In order to support these trends it is necessary to reflect the safety functionality in the software environment. This paper identifies user friendly solutions for this.

[Note from PLCopen: the last picture in Figure 4:above does reflect the future and is not covered in this document. Also dynamic changing of safety related parameters is not covered in this document. This can be covered in future updates or extensions of this work.]

## ***1.2. Positioning of work***

When we refer to safe motion in this document we consider the safety of the operating personnel in machines with moving parts. An example of such a machine is a mechanical press or a packaging machine.

Note that a “safety drive” is not to be confused with “safe drive [system]” which is referred to in the automotive sector.

Figure 5: Example of safe driving in automotive

## 2 General overview

When we refer to safe motion in this document we mean the safety of the operating personnel in machines with moving parts. This includes the motion of the different motors, combined with their drives, in the machine in a safe way.

In accordance with the Machinery Directive, when the drive is brought to a standstill, the operating status must be safely monitored and maintained.

In many cases this is done via Safe Motion Monitoring Functionalities (SMMF) - whether external or drive-integrated - like defined in IEC 61800-5-2. Safe motion monitoring can be implemented through speed monitoring and as a result potentially hazardous movements are safely detected and appropriate countermeasures can be initiated in time.

In Figure 6: Overview of the safe motion definitions and area this is depicted with the separation between the safety drives and safe motion control (or alternatively called safe motion monitoring).

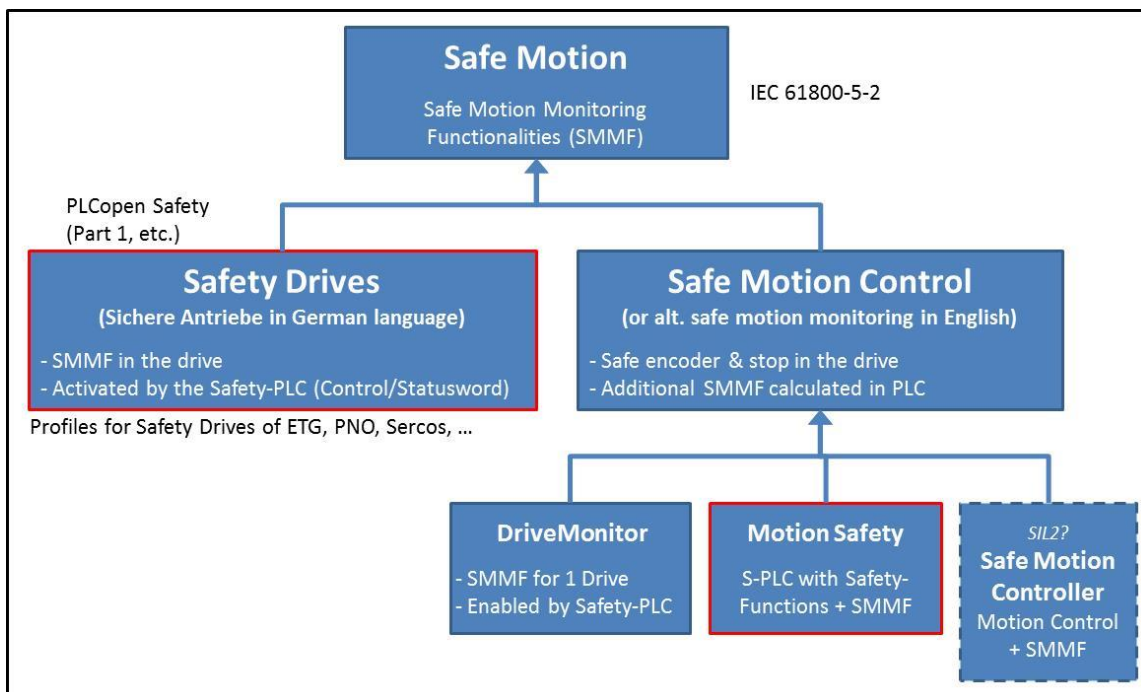

Figure 6: Overview of the safe motion definitions and area

The term “safe” is understood in terms of functional safety from the relevant (machinery) safety standards IEC 61508, IEC 62061, and ISO 13849-1.

## 2.1. Operational aspects of the safety function

In line with the hardwired safety functionality, the first step with multiple drives and motors is to include the safety monitoring function in the drive. As show in Chapter 1.1 a next option is to monitor this overall in a safety controller.

### Safety Drives: Safe Motion monitoring (SMMF) in Drive

*Safety Drives are drives with built-in safety functions. ... the drive can be run in different between modes [SMMF active | inactive]*

*Various safety functions are available in safety mode. The transitions between the safety functions normally get handled by a drive internal state machine and might underlay different priorities [and] drive ... parameters ....*

[Conform PLCopen Safety, Part 2]

Figure 7: Safe Motion monitoring in Drive

### Motion Safety: Safe Motion monitoring (SMMF) in Safety-PLC

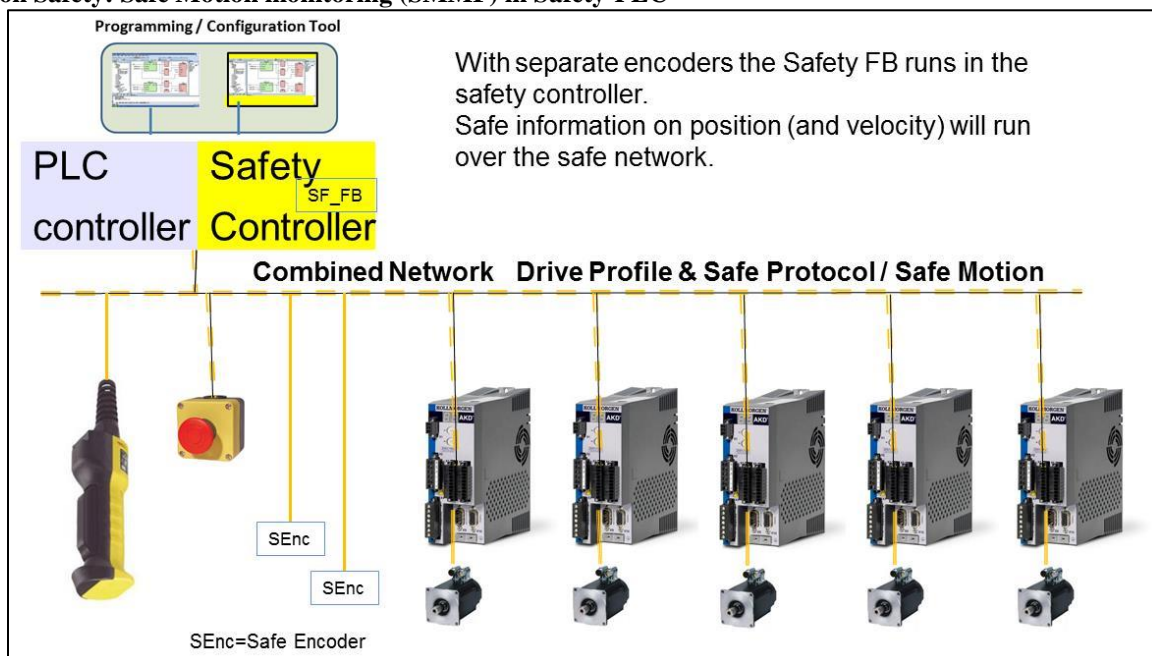

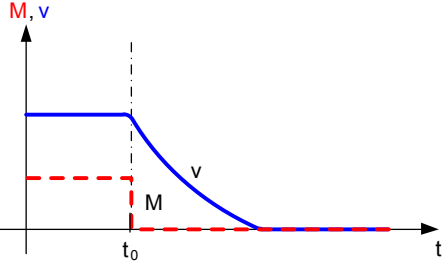

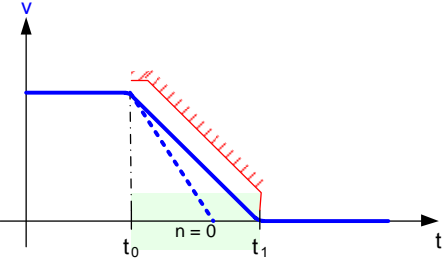

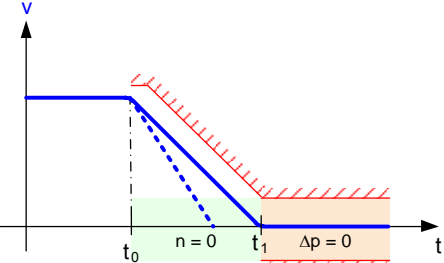

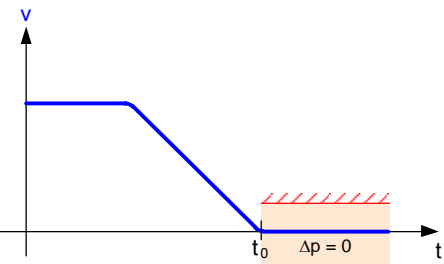

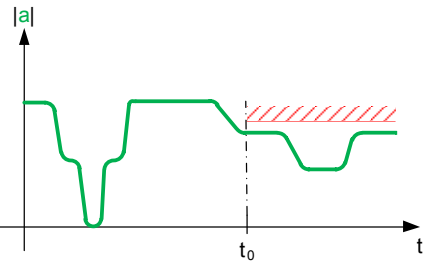

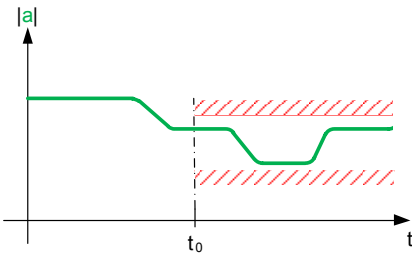

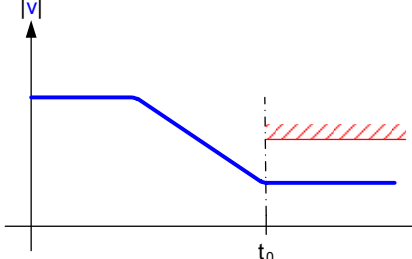

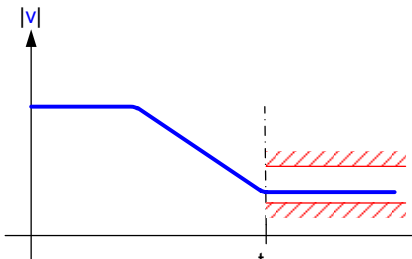

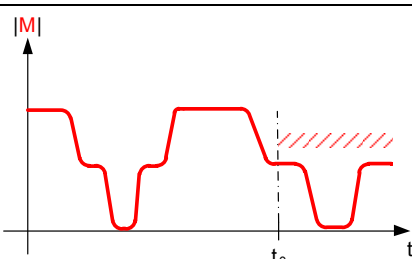

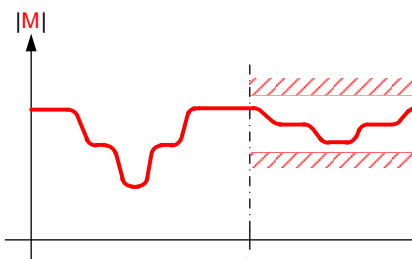

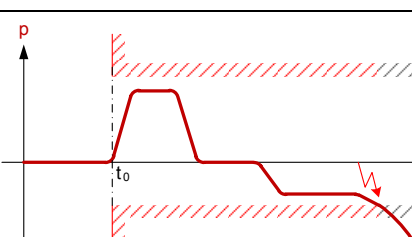

Figure 8: Safe Motion monitoring in Safety PLC

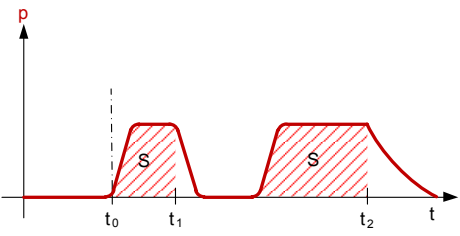

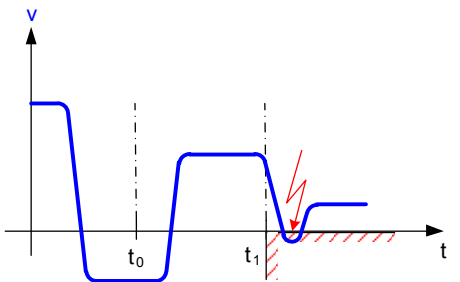

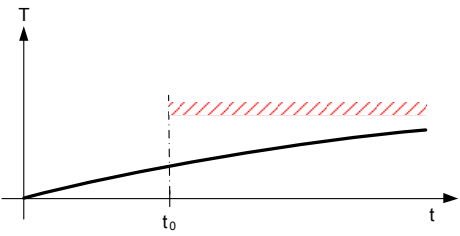

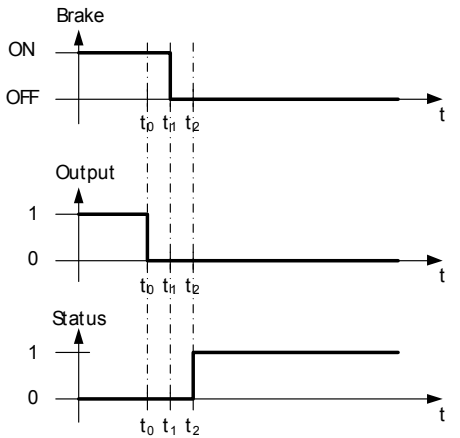

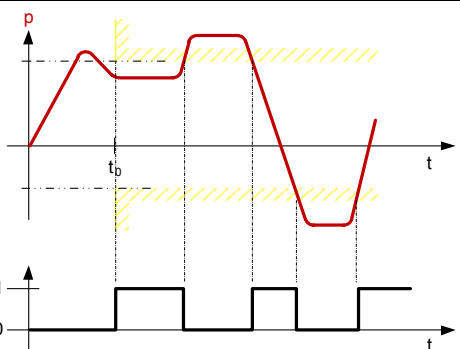

Note: the configuration in Figure 8: Safe Motion monitoring in Safety PLC is not yet covered in this specification.

## 2.2. Overview common safe motion functionalities

Conform to the relevant safety standard today (IEC 61800-5-2) the following motion related safety functions can be identified:

Function (EN61800-5-2:2007 Chapter)	English (German)	Icon	Description
STO 4.2.2.2	Safe torque off (Sicher abgeschaltetes Moment)		Power energy which, can cause any motion is not applied to the motor.
SS1 4.2.2.3	Safe stop 1 (Sicherer Stopp 1)		Motor Deceleration. STO after Deceleration.
SS2 4.2.2.4	Safe stop 2 (Sicherer Stopp 2)		Motor Deceleration. SOS after Deceleration.
SOS 4.2.3.1	Safe operating stop (Sicherer Betriebs halt)		Prevents the Motor from deviating more than a defined distance from the stopped position
SLA 4.2.3.2	Safely-limited acceleration (Sicher begrenzte Beschleunigung)		Prevents the Motor from exceeding the acceleration limit

Function	English (German)	Icon	Description
SAR 4.2.3.3	Safe acceleration range (Sicherer Beschleunigungs- bereich)		Keeps the motor acceleration / deceleration within specified limits.
SLS 4.2.3.4	Safely-limited Speed (Sicher begrenzte Geschwindigkeit)		Prevents the motor from exceeding the specified speed limit
SSR 4.2.3.5	Safe speed range (Sicherer Geschwindigkeits- bereich)		Keeps the motor speed within specified limits
SLT 4.2.3.6	Safely-limited torque (Sicher begrenztes Moment)		Prevents the motor from exceeding the specified torque / force
STR 4.2.3.7	Safe torque range (Sicherer Momenten-bereich)		Keeps the motor torque / force within the specified limits
SLP 4.2.3.8	Safely-limited position (Sicher begrenzte Position)		Prevents the motor shaft from exceeding the position limits

Function	English (German)	Icon	Description
SLI 4.2.3.9	Safely-limited increment (Sicher begrenztes Schrittmaß)		Prevents the motor shaft from exceeding the limit of position increment
SDI 4.2.3.10	Safe direction (Sichere Bewegungsrichtung)		Prevents the motor shaft from moving in the unintended direction
SMT 4.2.3.11	Safe motor temperature (Sichere Motortemperatur)		Prevents the motor temperature from exceeding a specified upper limit.
SBC 4.2.3.12	Safe Brake Control (Sichere Bremsenansteuerung)		Provide safe output signal(s) to control the external brake(s) [Note: Safe Brake Control is often linked to Safe Break Test (SBT). However the latter functionality is not covered in this document]
SCA 4.2.3.13	Safe cam (Sicherer Nocken)		Safe output Signal to indicate the motor shaft is within a specified range

Function	English (German)	Icon	Description
SSM 4.2.3.14	Safe speed monitor (Sichere Geschwindigkeits- überwachung)	<p>The icon consists of two vertically aligned graphs. The top graph plots torque (M) on the vertical axis against time (t) on the horizontal axis. A blue line shows a speed profile that starts at a constant level, ramps up to a higher constant level, then ramps down to zero, and finally ramps up to a level below the first constant level. A horizontal yellow hatched band is drawn across the graph, representing a speed limit. Vertical dashed lines mark the start and end of the speed limit band. The bottom graph plots a digital output signal on the vertical axis (values 0 and 1) against time (t) on the horizontal axis. The signal is high (1) when the speed is within the yellow hatched band and low (0) when the speed is outside the band.</p>	Safe output signal to indicate whether the motor speed is below a specified limit

**Abbreviations in the pictures above**

v ... Speed  
n ... Rotation Speed  
a ... acceleration

M ... Torque, Force  
p ... Position  
T ... Temperature

Alternatively:

<b>STO</b>	Safe Torque Off	Safe Stop and brake functions
<b>SS1</b>	Safe Stop 1	Safe Stop and brake functions
<b>SOS</b>	Safe Operating Stop	Safe Stop and brake functions
<b>SS2</b>	Safe Stop 2	Safe Stop and brake functions
<b>SBC</b>	Safe Brake Control	Safe Stop and brake functions
<b>SLA</b>	Safety Limited Acceleration	Safe Motion Functions
<b>SAR</b>	Safe Acceleration range	Safe Motion Functions
<b>SLS</b>	Safety Limited Speed	Safe Motion Functions
<b>SSR</b>	Safe Speed Range	Safe Motion Functions
<b>SLT</b>	Safely-Limited Torque	Safe Motion Functions
<b>STR</b>	Safe Torque Range	Safe Motion Functions
<b>SLP</b>	Safely-Limited position	Safe Motion Functions
<b>SLI</b>	Safely-Limited Increment	Safe Motion Functions
<b>SDI</b>	Safe Direction	Safe Motion Functions
<b>SCA</b>	Safe Cam	Safe Motion Functions
<b>SSM</b>	Safe Speed Monitor	Safe Motion Functions
<b>SMT</b>	Safe Motor Temperature	Safe Motion Functions

These functions can be grouped in the following order:

Safe Stop and brake functions		Safe Motion Basics Functions		Safe Motion Advance Functions	
		<b>STO</b>	Safe Torque Off	<b>SLS</b>	Safety Limited Speed
<b>SS1</b>	Safe Stop 1	<b>SS1</b>	Safety Stop 1. maintaining power and after certain time delay OFF	<b>SAR</b>	Safe Acceleration range
<b>SOS</b>	Safe Operating Stop	<b>SS2</b>	(Stop function) like Stop Cat.2 of EN60204, Controlled shut down while maintaining the supply of power, and after Standstill Can includes SOS	<b>SSR</b>	Safe Speed Range
<b>SS2</b>	Safe Stop 2	<b>SLP</b>	Safely-Limited position	<b>SLT</b>	Safely-Limited Torque
<b>SBC</b>	Safe Brake Control	<b>...</b>	SafeEncoder. Combine to encoders	<b>STR</b>	Safe Torque Range
				<b>SLI</b>	Safely-Limited Increment
				<b>SDI</b>	Safe Direction
				<b>SCA</b>	Safe Cam
				<b>SSM</b>	Safe Speed Monitor
				<b>SMT</b>	Safe Motor Temperature

Figure 9: Grouped overview of safety functions

Concerning the safety parameters, the following statement can be made:

**Parameter settings of the monitoring functions**

<< Ref. Pilz 2011 [The Safety Compendium Chapter 6 SafeMotion]>>

*Safe motion monitoring requires not just safe motion detection but also the opportunity to specify limit values safely. The way in which this is achieved depends on the level of dynamics and the flexibility within the machine.*

Limit values	Description	Dynamics
Constant	Fixed during commissioning and cannot be amended during operation	-
Selectable	Possible to select/change the appropriate value from a fixed set of limit values during operation	O
Dynamic	Limit values are calculated and adjusted during operation	+

As example of dynamic limit values one can look at robotics: the safe speed of the robot can be reduced depending on the distance of the operator from the hazard zone: the closer the operator comes to the danger zone, the slower the robot moves This involves the safety logic and is calculated in the software

<< Note: Safety Controller is often seen as a separate unit. Safety Logic can be part of the safety controller or in the safety drive >>

### **3 Mapping to the safe profiles in the networks**

In order to use the safety integrated networks the safety functions have to be mapped. This chapters combined with 5 Safe Profiles provides an overview; however this can be incomplete and is not intended for implementations. For this purpose the applicable network standards have to be used. Also note that there is no preference or order applicable here: it is just a small overview.

What is generic in the current status of the safety integrated networks is that there are basically two bytes or a word (double bytes) used for communicating the safety commands and status. However there are slight differences in the content and meaning of the words at bit level.

Overview Control Byte

Bit	OMAC	ProfiSafe	EtherCAT	OpenSafety	CIP / Sercos	CC-Link IE	MECHATRO LINK
0	STO	STO	STO	Reset	Mode	STO	STO
1	SS1	SS1	SS1	Activate	Emergency Stop	SS1	SS1
2	SS2	SS2	SS2	STO	Enabling	SS2	SS2
3	SOS	SOS	SOS	SBC	SMM1	SOS	SOS
4	SLS	SLS	SSR	SS1	SMM2	SSR	SSR
5	UserD	SLT	SDIp	Reserved	SMM3	SDIp	SDIp
6	UserD	SLP	SDIn	Vendor	SMM4	SDIn	SDIn
7	Error Ack	Internal	Error Ack	Vendor	SMM5	Error Ack	Error Ack

More detailed information on the different networks can be found in Chapter 5 Safe Profiles .

## 4 Proposal for Safety Drives

This proposal is based on the architecture that the safety functionality is in the drive, incl. all relevant parameters, as shown in Figure 7: Safe Motion monitoring in Drive.

### 4.1. *SF\_SafetyRequest for activating & monitoring the drive*

In PLCopen Safety Part 1 the Function Block SF\_SafetyRequest is defined. The graphical representation is:

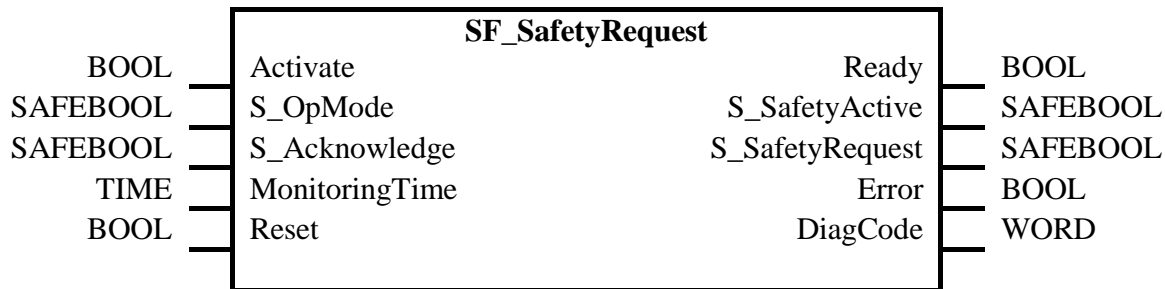

Figure 10: Graphical representation of SF\_SafetyRequest

The relevant inputs and outputs are shown in Figure 11: Description of SF\_SafetyRequest with reduced set of inputs and outputs, providing a basic overview of the functionality.

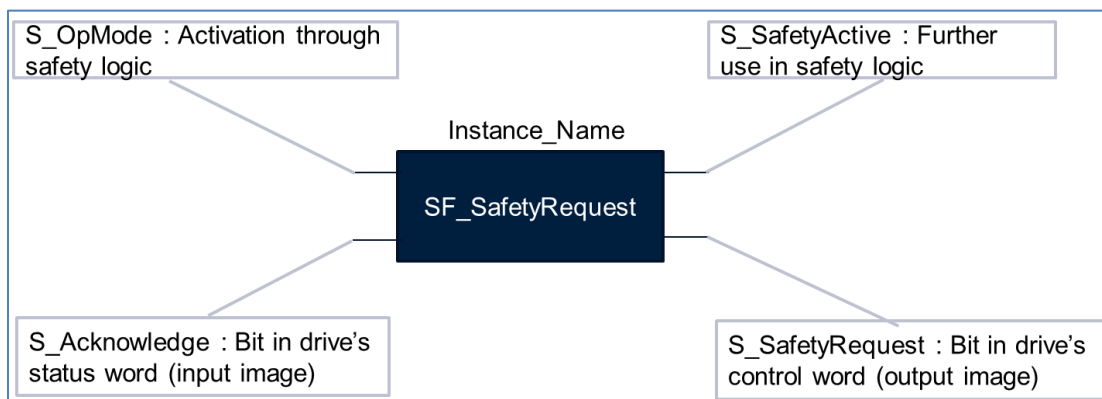

Figure 11: Description of SF\_SafetyRequest with reduced set of inputs and outputs

The main inputs and outputs of SF\_SafetyRequest shall be linked as follows:

- Top-left (*Activation through safety logic*): Input **S\_OpMode** is linked to the logic determining whether the safety drive function (e.g. safely limited torque) needs to become active within the time specified on input MonitoringTime (not shown). S\_OpMode may be connected to the output value of an FB monitoring a device (e.g. SF\_ESPE monitoring a light curtain, or SF\_ModeSelector monitoring a mode selecting device), or some combination of conditions.
- Top right (*Further use in safety logic*): Output **S\_SafetyActive** provides the feedback whether the safety drive function has become active *within the specified monitoring time* after its need has been determined (input S\_OpMode). If this output is active it can be used to activate the next step, like e.g. opening a gate.
- Bottom left (*Bit in drive's status word*): Input **S\_Acknowledge** reflects the status of the drive relevant to the safety drive function requested by this FB (e.g. whether the limitation of torque is currently active), and is the reflection of the process input image w.r.t. to the drive.
- Bottom right (*Bit in drive's control word*): Output **S\_SafetyRequested** is the bit that goes to the drive in the safe control word for activating the function in the drive. Note that the control word can be a byte.

If the input on the top left is FALSE, there is no activation so output top right is FALSE. However if there is a safety request and the input top left is TRUE, the top right output reflects the status of the drive or its exceeding of the monitoring time. The bottom right bit reflects the operation by setting the relevant bit in the control word for safety active, and after acknowledge of this in the safety drive, the bottom left input reflects this change (to TRUE).

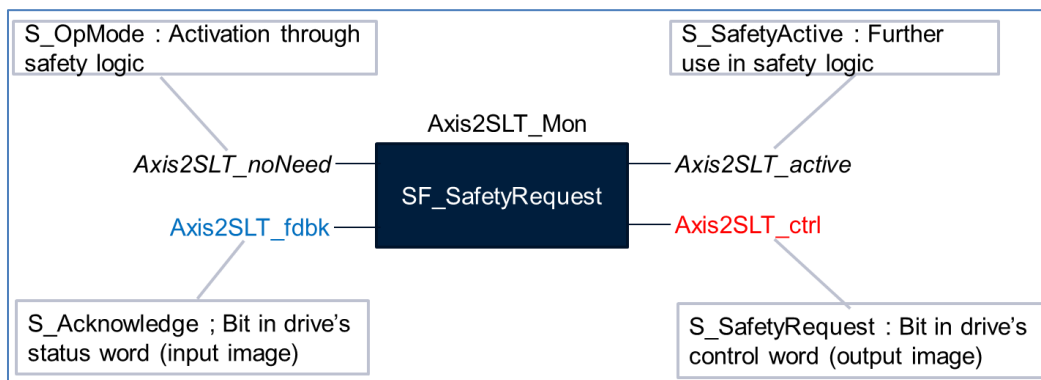

Figure 12: Extended description of SF\_SafetyRequest with reduced set of inputs and outputs

This SF\_SafetyRequest functionality can be used in a broad safety sense, incl. the safe motion functionalities. For instance, in order to use this FB for SLT (Safely Limited Torque) one combines the inputs Axis2SLT\_noNeed and Axis2SLT\_fdbk to generate the relevant safety outputs Axis2SLT\_active and Axis2SLT\_ctrl, as depicted in Figure 12: Extended description of SF\_SafetyRequest with reduced set of inputs and outputs, providing the required safety functionality. Multiple instances of SF\_SafetyRequest may be used to cover all safety drive functions (IEC61800, profiles, vendor-specific).

In this way most of the safety drive functionalities can be mapped easily, especially by providing a “guideline” with defined naming conventions, containing a generic scheme how to name signals related to the functions supported by a safety drive as described in Par. 4.2 The Safety Drive Naming Scheme. Combined with an I/O or Drive configurator these names can be generated automatically for the bits in the drive’s status / control word, matching the drive’s profile (symbolic names).

In this way PLCopen provides all these SafeMotion functionalities, while it covers multiple instances of the same function on the same drive, e.g. 2 x SLS with different velocities. And it allows the application to distinguish the activation of SS1 from the activation of STO, and also the activation of SS2 from the activation SOS, in drives that supports these functions separately (*Note, the specialized PLCopen FB SF\_SafeStop1 does not guarantee activating SS1, but might activate STO, depending on the drive, and SF\_SafeStop2 does not guarantee activating SS2, but might activate SOS. The application cannot choose which one should be activated in the current situation.*) Also for the supplier the certification process gets much simpler, while the user gets a consistent user interface that supports all needed functionalities, and even can group the same functionalities easily to provide a better overview of the safety application program.

## 4.2. The Safety Drive Naming Scheme

In order to have a consistent interface, the following naming scheme is proposed. For every safety drive  $d$  and every safety drive function  $f$  supported by the drive according to its profile and configuration, the corresponding FB instance and I/O signals shall be given the following names:

	if $d$ has one instance of $f$	if $d$ has multiple instances of $f$
Name of the SF_SafetyRequest instance	SF_<math>d</math><math>f</math>_Mon	SF_<math>d</math><math>f</math><math>k</math>_Mon
Symbolic name of the bit in the input image indicating that the drive function is now active	S_<math>d</math><math>f</math>_fdbk	S_<math>d</math><math>f</math><math>k</math>_fdbk
Symbolic name of the bit in the output image by which the drive function is requested	S_<math>d</math><math>f</math>_ctrl	S_<math>d</math><math>f</math><math>k</math>_ctrl

where

$d$  is the name given to the safety drive in the application;

$f$  is the acronym for the safety drive function; for standard safety drive functions the following common acronyms shall be used:

$f \in \{ \text{STO, SS1, SS2, SOS, SBC, SLA, SLI, SLP, SLS, SLT, SAR, SSR, STR, SDI, SEL, SCA, SSM, SMT} \};$

$k$  is the number of the instance of the safety drive function (if the drive is configured to have multiple instances of the same drive instance).

Hereunder an overview of the different names for the different safety functionalities as example:

Function	English	Instance Name	InputNames	OutputNames
STO	Safe torque off	SF_Axis1STO_Mon	S_Axis1STO_fdbk	S_Axis1STO_ctrl
SS1	Safe stop 1	SF_Axis2SS1_Mon	S_Axis2SS1_fdbk	S_Axis2SS1_ctrl
SS2	Safe stop 2	SF_Axis3SS21_Mon	S_Axis3SS21_fdbk	S_Axis3SS21_ctrl
SOS	Safe operating stop	SF_Axis1SOS2_Mon	S_Axis1SOS2_fdbk	S_Axis1SOS2_ctrl
SLA	Safely-limited acceleration	SF_Axis2SLA_Mon	S_Axis2SLA_fdbk	S_Axis2SLA_ctrl
SAR	Safe acceleration range	SF_Axis1SAR2_Mon	S_Axis1SAR2_fdbk	S_Axis1SAR2_ctrl
SLS	Safely-limited Speed	SF_Axis2SLS_Mon	S_Axis2SLS_fdbk	S_Axis2SLS_ctrl
SSR	Safe speed range	SF_Axis1SSR1_Mon	S_Axis1SSR1_fdbk	S_Axis1SSR1_ctrl
SLT	Safely-limited torque	SF_Axis2SLT_Mon	S_Axis2SLT_fdbk	S_Axis2SLT_ctrl
STR	Safe torque range	SF_Axis1STR_Mon	S_Axis1STR_fdbk	S_Axis1STR_ctrl
SLP	Safely-limited position	SF_Axis3SLP_Mon	S_Axis3SLP_fdbk	S_Axis3SLP_ctrl
SLI	Safely-limited increment	SF_Axis4SLI2_Mon	S_Axis4SLI2_fdbk	S_Axis4SLI2_ctrl
SDI	Safe direction	SF_Axis2SDI_Mon	S_Axis2SDI_fdbk	S_Axis2SDI_ctrl
SMT	Safe motor temperature	SF_Axis1SMT_Mon	S_Axis1SMT_fdbk	S_Axis1SMT_ctrl
SBC	Safe Brake Control	SF_Axis2SBC1_Mon	S_Axis2SBC1_fdbk	S_Axis2SBC1_ctrl
SCA	Safe cam	SF_Axis1_SCA_Mon	S_Axis1_SCA_fdbk	S_Axis1_SCA_ctrl
SSM	Safe speed monitor	SF_Axis2SSM_Mon	S_Axis2SSM_fdbk	S_Axis2SSM_ctrl

### Abbreviations

**S** ... Speed and/or Safety (as first letter)      **T** ... Torque, Force or Temperature

Note: the feedback input for SS1 and SS2 may not be implemented by a direct mapping to a corresponding status bit in the different profiles, but need to be assembled from different status signals.

### 4.3. An example of the mapping to the safe profile

As an example on how to map this functionality to a drive / axes via the applicable safe profile, we look at a CIP-safety-of-Sercos drive “MyAxis” that has its Safe Motion Monitoring function #1 configured to be the “safely limited speed” function. Then the SF\_SafetyRequest instance monitoring this function on MyAxis shall have the name “MyAxisSLS\_Mon”, bit #2 of MyAxis’s status word in the input image shall have the symbolic name “MyAxisSLS\_fdbk”, and bit #3 of MyAxis’s control word in the output image shall have the symbolic name “MyAxisSLS\_ctrl”.

### 4.4. Example of using one instance for multiple axes

There can be linked more than one axis to the same instance of SF\_SafetyRequest and in this way provide the same safety functionality to all related axes. As shown in Figure 13: Programming example with multiple axes for the SOS functionality, the different axes are linked to the same output S\_SafetyRequest, and the corresponding feedback signals are grouped via the AND functionality to the S\_Acknowledge, closing the safety loop. In case the one of the drives does not confirm the correct status within the specified monitoring time, the function block will set the safe mode.

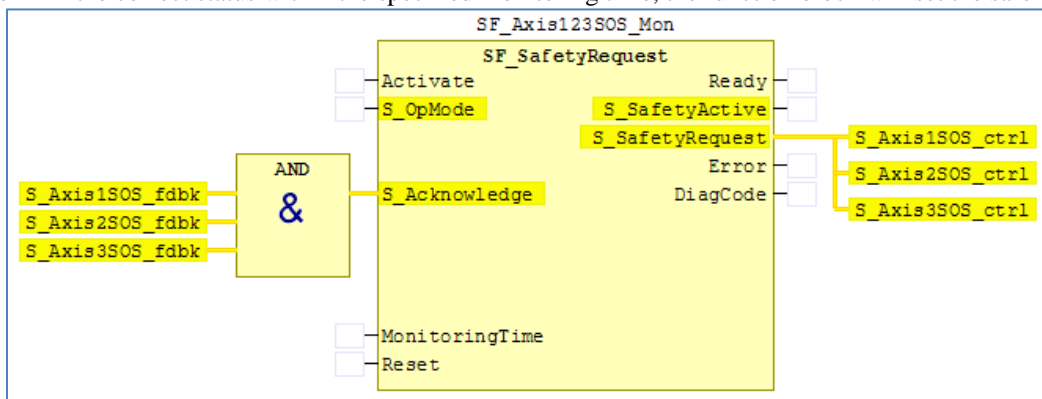

Figure 13: Programming example with multiple axes with same SafeMotion functionality

With this principle all axes that will have the same SafeMotion functionality can be grouped, and thus limiting the size of the program while enhancing the overview.

A safety drive can include multiple SafeMotion modes which can be switched during operation, meaning that they are not hard-wired. In the case of multiple function requests, priorities have to be set, which shall be according to the following table, starting with the highest priority:

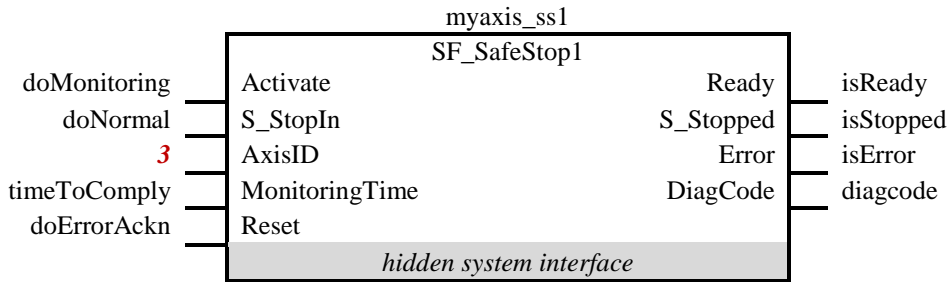

Priority	Function
1	STO
2	SS1
3	SS2
4	SLS
	SOS
	SDI
	SLI

## 4.5. Example of safe stop and safely limited speed

PLCopen Safety Software part 1 specifies three motion-specific function blocks with a hidden system-level interface to the drive. These too may be substituted by SF\_SafetyRequest in accordance with the naming scheme.

### 4.5.1. Substituting SF\_SafeStop1

SF\_SafeStop1 initiates a controlled stop of an electrical drive in accordance with stop category 1 - with power available to the machine actuators to achieve the stop and then removal of the power when the stop is achieved.

A use of the SF\_SafeStop1 instance as above can be substituted by a use of SF\_SafetyRequest as follows:

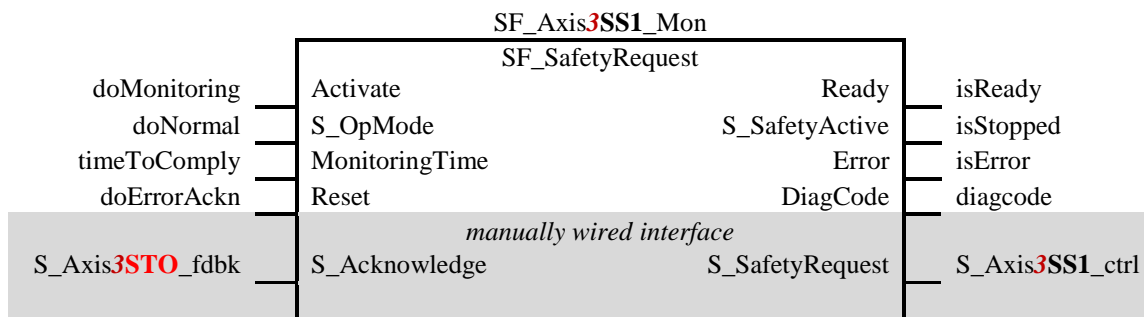

Figure 14: Mapping of SF\_SafeStop1

Note: Drive profiles do not provide a specific status bits for the successful completion of the *safe stop 1* request. The request is completed successfully when the target state “safe torque off” of the *safe stop 1* request has been reached. Hence SF\_SafetyRequest has to wired to the STO status bit. (Profisafe has an SS1\_Active status, but it indicates the beginning of safe stopping, not its successful completion).

### 4.5.2. Substituting SF\_SafeStop2

Safe stop 2 differs from safe stop 1 in the target status. The *safe stop 2* request has been completed successfully when the state “safe operating stop” has been reached. (Profisafe has an SS2\_Active status, but it indicates the beginning of safe stopping, not its successful completion). Correspondingly, the safety output of SF\_SafeStop2 is called S\_Standstill instead of S\_Stopped. Hence the substitute for SF\_SafeStop2 looks as follows:

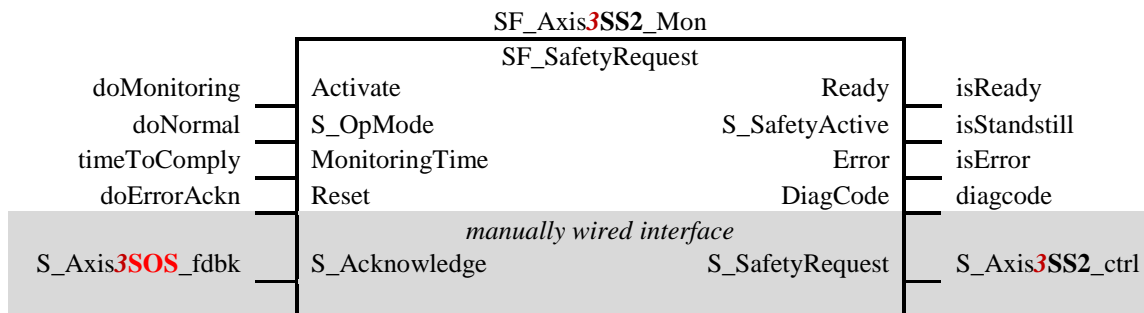

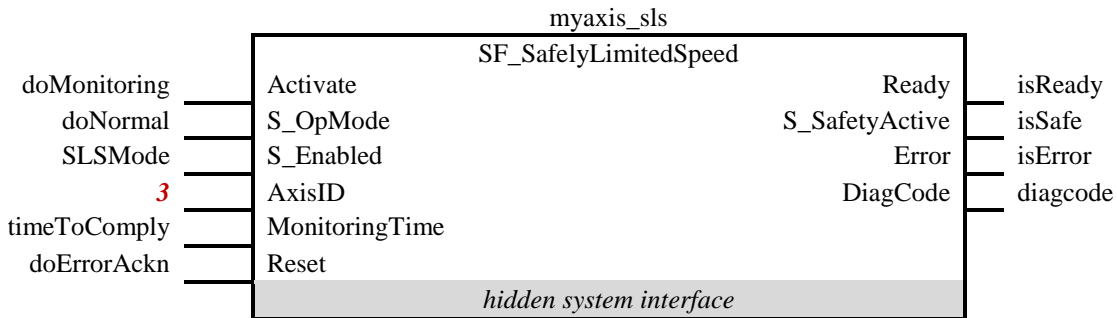

Figure 15: Mapping of SF\_SafeStop2

### 4.5.3. Substituting SF\_SafelyLimitedSpeed

SF\_SafelyLimitedSpeed acts as the interface between the application program and the system environment. The supplier-specific details of the axis safety function are implemented on the system level and are hidden from the application programmer.

Substituting SF\_SafelyLimitedSpeed is more complicated because it combines two drive functions in one function block: Normally it activates the *safely limited speed* function (S\_Enabled = true). But if S\_Enabled = false, it activates the *safe operating stop* function (effectively a speed limited of zero). Hence the substitution of a SF\_SafelyLimitedSpeed instance requires the manual wiring of *two* status and control bits: those for the drive's *safely limited speed* function and those for its *safe operating stop* function:

And implementing the functionality of SF\_SafelyLimitedSpeed requires two instances of SF\_SafetyRequest and their connection with the input and output signals.

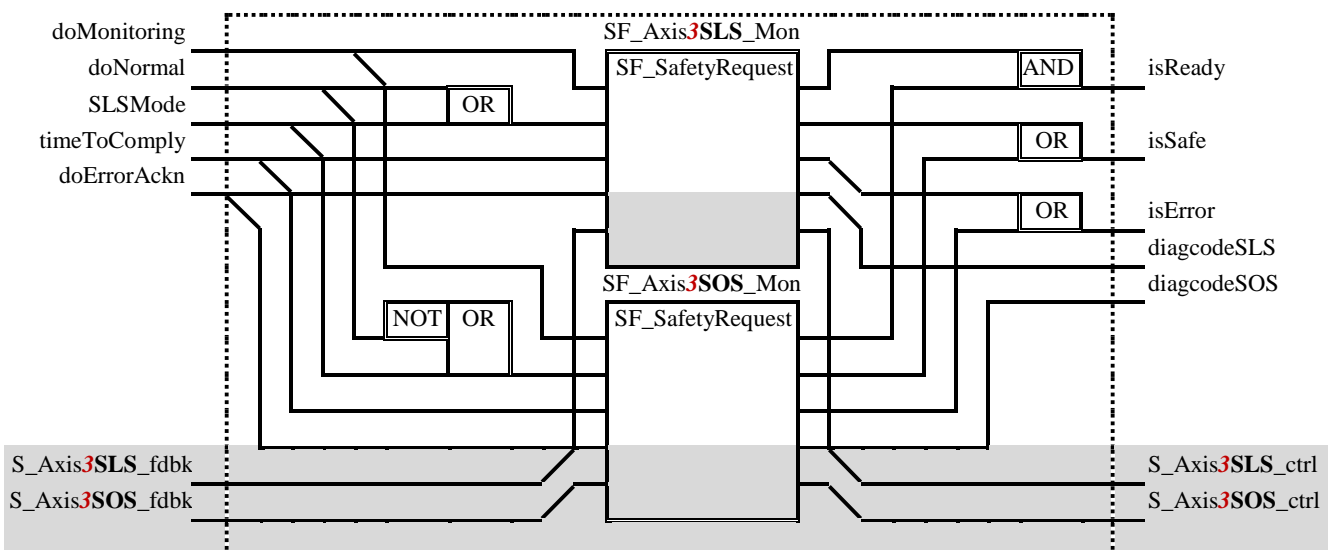

Figure 16: Mapping of SF\_SafelyLimitedSpeed

### 4.6. Example of mapping on the OMAC specification

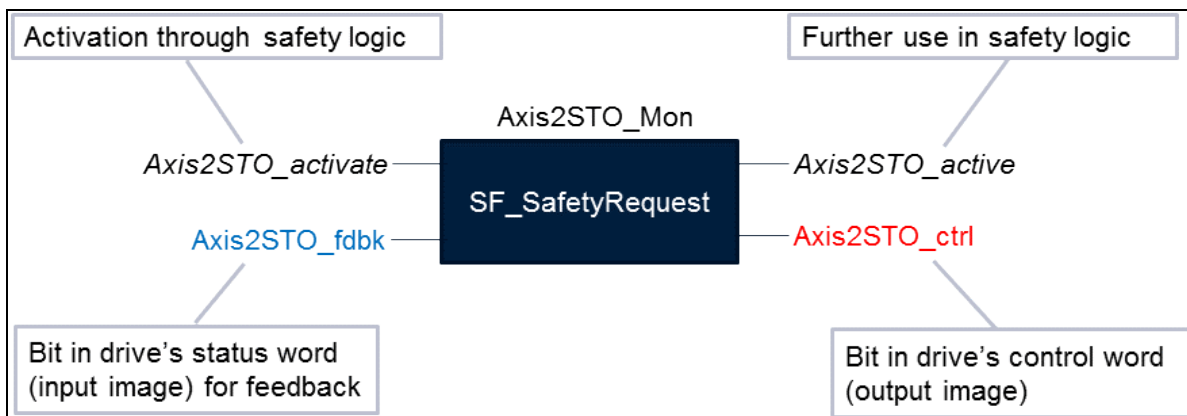

The naming convention for the symbolic I/O variables can be mapped to the different protocols via aliases. For example, if we look to the OMAC control and status bytes, this can be done in the following way for the example above:

Enabled AND OpMode in the SF\_SafetyLimitedSpeed releases the safety functionality, so the output parameter S\_Axis1SOS\_ctrl bit is linked to the bit number 3 in the control byte. So there is a first drive called Drive1, which is mapped to the bit Drive1.SOS, or alias Axis1.SOS.

(Just to help here a copy of the OMAC control and status words:

Safety Control Byte			Safety Status Byte		
Bit	Name	Description	Bit	Name	Description
0	STO	Safe Torque Off 0: activate 1: deactivate	0	STO active	Safe Torque off 0: is not active 1: is active
1	SS1	Safe Stop 1 0: activate 1: deactivate	1	---	Note: Bit SS1 is not part of the Safety Statusbyte. During deceleration part of the function the machine is still in movement, the status SS1 can be part of standard status information. At the end the resulting stop function STO is reflected in Bit 0
2	SS2	Safe Stop 2 0: activate 1: deactivate	2	---	Note: Bit SS2 is not part of the Safety Statusbyte. During deceleration part of the function the machine is still in movement, the status SS2 can be part of standard status information. At the end the resulting stop function SOS is reflected in Bit 3
3	SOS	Safe Operating Stop 0: activate 1: deactivate	3	SOS active	Safe Operating Stop 0: is not active 1: is active
4	SLS	Safely-limited Speed 0: activate 1: deactivate	4	SLS active	Safely-limited Speed 0: is not active 1: is active and speed of the drive is within the safe speed range
5	Safety Function 1	Machine specific safety function e.g. SLA, SAR, SLT, SLP, SDI <sup>2</sup> 0: activate 1: deactivate	5	Safety Function 1 active	Machine specific safety function 1 active 0: is not active 1: is active
6	Safety Function 2	Machine specific safety function e.g. SLA, SAR, SLT, SLP, SDI 0: activate 1: deactivate	5	Safety Function 2 active	Machine specific safety function 2 active 0: is not active 1: is active
7	Error Ack	Error Acknowledge 0: no acknowledge 0→1: Acknowledge of an error in the drive	7	Error indication	Error indication 0: no Error 1: at least one safety-related error has occurred

If we map for example the Safe Torque Off functionality, it is the first bit in both the control and status byte. If we use Axis 2 for this example, the mapping of SF\_SafetyRequest could look like:

Axis2STO\_ctrl would be mapped to the first bit in safety control byte in the OMAC protocol. In this way also the feedback is created via coupling to the first bit of the Safety Status Byte.

## 5 Safe Profiles

### 5.1. OMAC

	<p align="center"><b>PackSafety Machine Safety Interface</b></p>	<p align="center">Doc. ID: OMAC PackSafety Rev. 0.3 Date : 25.04.2013</p>
---	--	---

Check [www.OMAC.org](http://www.OMAC.org)

The organization OMAC considers complete production lines where the safety aspects are not just limited to one machine, but these are interconnected. This can be done with a centralized or de-centralized approach.

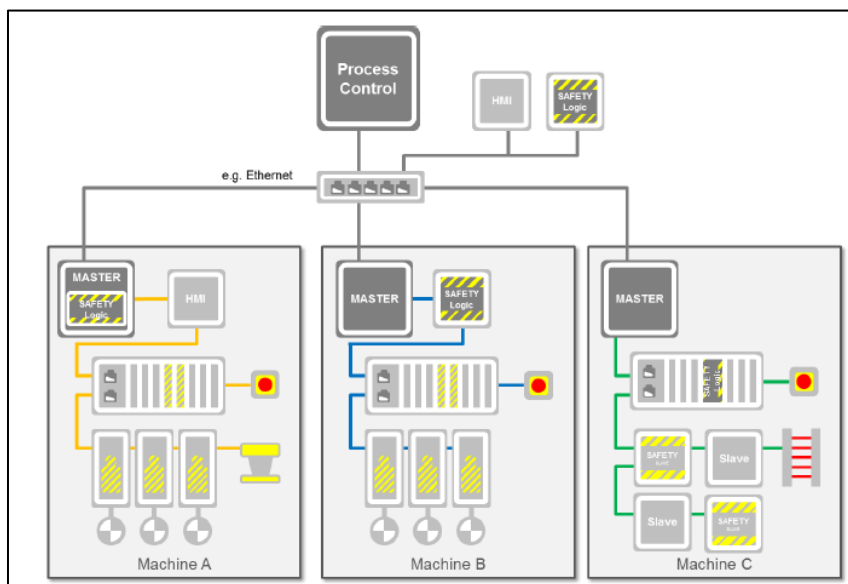

Figure 17: Plant wide safety machine architecture

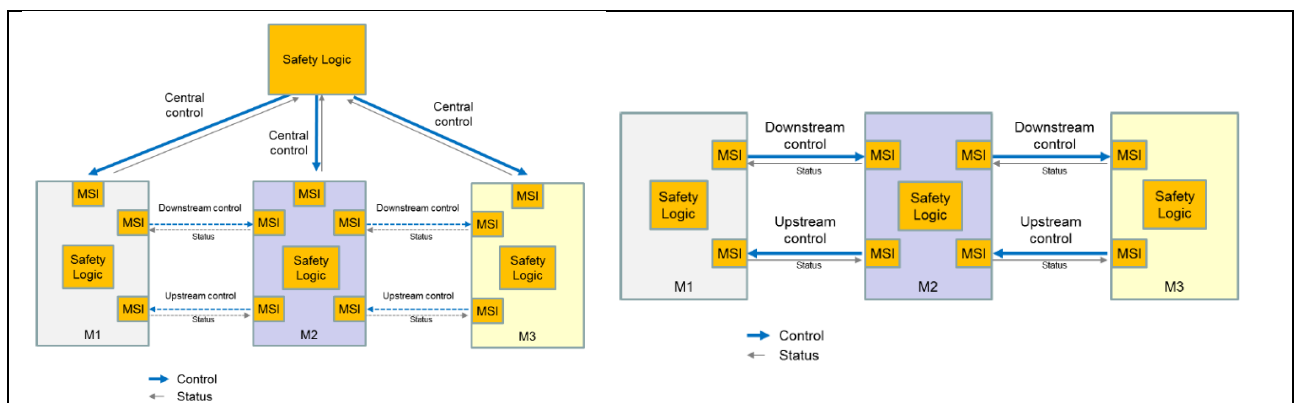

Figure 18: Centralized versus de-centralized safety solution

Safety Control Byte			Safety Status Byte		
Bit	Name	Description	Bit	Name	Description
0	STO	Safe Torque Off 0: activate 1: deactivate	0	STO active	Safe Torque off 0: is not active 1: is active
1	SS1	Safe Stop 1 0: activate 1: deactivate	1	---	Note: Bit SS1 is not part of the Safety Statusbyte. During deceleration part of the function the machine is still in movement, the status SS1 can be part of standard status information. At the end the resulting stop function STO is reflected in Bit 0
2	SS2	Safe Stop 2 0: activate 1: deactivate	2	---	Note: Bit SS2 is not part of the Safety Statusbyte. During deceleration part of the function the machine is still in movement, the status SS2 can be part of standard status information. At the end the resulting stop function SOS is reflected in Bit 3
3	SOS	Safe Operating Stop 0: activate 1: deactivate	3	SOS active	Safe Operating Stop 0: is not active 1: is active
4	SLS	Safely-limited Speed 0: activate 1: deactivate	4	SLS active	Safely-limited Speed 0: is not active 1: is active and speed of the drive is within the safe speed range
5	Safety Function 1	Machine specific safety function e.g. SLA, SAR, SLT, SLP, SDI <sup>2</sup> 0: activate 1: deactivate	5	Safety Function 1 active	Machine specific safety function 1 active 0: is not active 1: is active
6	Safety Function 2	Machine specific safety function e.g. SLA, SAR, SLT, SLP, SDI 0: activate 1: deactivate	5	Safety Function 2 active	Machine specific safety function 2 active 0: is not active 1: is active
7	Error Ack	Error Acknowledge 0: no acknowledge 0→1: Acknowledge of an error in the drive	7	Error indication	Error indication 0: no Error 1: at least one safety-related error has occurred

## 5.2. ProfiSafe

(Note: the table references are to the original document)

### 5.2.1. Safety control word 1 (S\_STW1)

Each autonomous safety drive function will be activated by a separate bit. A drive based safety function to be used in an application has to be explicitly enabled in the drive by use of parameterisation. The user data length of the signal S\_STW1 is 2 bytes. The meaning of the bits 0 to 7 will be defined in this profile. The bits 8 to 15 may be used in a device specific way. In future versions, bits marked with “reserved”, may be used for the activation of other autonomous safety functions of drives [7]. Reserved bits should be set to “0” as default.

The structure of the PROFIdrive Safety control word 1 is shown in Table 1.

**Table 1: Overview on the assignment of the bits of Safety control word 1**

Byte	Bit	Name	Significance
0	0	STO	No Safe Torque Off / Safe Torque Off (zero-active)
0	1	SS1	No Safe Stop 1 / Safe Stop 1 (zero-active)
0	2	SS2	No Safe Stop 2 / Safe Stop 2 (zero-active)
0	3	SOS	No Safe Operational Stop / Safe Operational Stop (zero-active)
0	4	SLS	No Safe Limited Speed / Safe Limited Speed (zero-active)
0	5	SLT	No Safe Limited Torque / Safe Limited Torque (zero-active)
0	6	SLP	No Safe Limited Position / Safe Limited Position (zero-active)
0	7	INTERNAL_EVENT_ACK	Safety Fault Buffer Fault Acknowledge (1 -> 0)
1	0 to 7	-	Device-specific

Explanation: The significance for bit value = 1 is to the left of the slash; bit value = 0 to the right.

### 5.2.2. Safety control word 2 (S\_STW2)

Each autonomous safety drive function will be activated by a separate bit. A drive based safety function to be used in an application has to be explicitly enabled in the drive by use of parameterisation. The user data length of the signal S\_STW2 is 4 bytes. The meaning of the bits 0 to 23 will be defined in this profile. The bits 24 to 31 may be used in a device specific way. In future versions, bits marked with “reserved”, may be used for the activation of other autonomous safety functions of drives [7]. Reserved bits should be set to “0” as default.

The structure of the PROFIdrive Safety control word 2 is shown in Table 3..

**Table 3: Overview on the assignment of the bits of Safety control word 2**

Byte	Bit	Name	Significance
0	0	STO	No Safe Torque Off / Safe Torque Off (zero-active)
0	1	SS1	No Safe Stop 1 / Safe Stop 1 (zero-active)
0	2	SS2	No Safe Stop 2 / Safe Stop 2 (zero-active)
0	3	SOS	No Safe Operational Stop / Safe Operational Stop (zero-active)
0	4	SLS	No Safe Limited Speed / Safe Limited Speed (zero-active)
0	5	SLT	No Safe Limited Torque / Safe Limited Torque (zero-active)
0	6	SLP	No Safe Limited Position / Safe Limited Position (zero-active)

Byte	Bit	Name	Significance
0	7	INTERNAL_EVENT_ACK	Safety Fault Buffer Fault Acknowledge (1 -> 0)
1	0	-	Reserved for future use
1	1	SLS_LIMIT_BIT0	Bit 0 for selection of SLS speed limit value
1	2	SLS_LIMIT_BIT1	Bit 1 for selection of SLS speed limit value
1	3	-	Reserved for future use
1	4	SDI_P	Safe Direction Positive inactive / Safe Direction Positive active, only positive speed (zero-active)
1	5	SDI_N	Safe Direction Negative inactive / Safe Direction Negative active, only negative speed (zero-active)
1	6	-	Reserved for future use
1	7	-	Reserved for future use
2	0	SLT_LIMIT_BIT0	Bit 0 for selection of SLT torque limit value
2	1	SLT_LIMIT_BIT1	Bit 1 for selection of SLT torque limit value
2	2	-	Reserved for future use
2	3	SLP_LIMIT_BIT0	Bit 0 for selection of SLP Position limit value set
2	4	SLP_LIMIT_BIT1	Bit 1 for selection of SLP Position limit value set
2	5 to 7	-	Reserved for future use
3	0 to 7	-	Device-specific

Explanation: The significance for bit value = 1 is to the left of the slash; bit value = 0 to the right.

### 5.2.3. Safety status word 1 (S\_ZSW1)

Different states of autonomous safety drive functions will be reported by different bits in the PROFIdrive Safety status word 1. An autonomous safety drive function to be used in an application has to be enabled explicitly in the drive by use of parameterization. The user data length of the „PROFIdrive Safety status word 1“ is 2 bytes. The meaning of the bits 0 to 7 will be defined in this profile. The bits 8 to 15 may be used in a manufacturer specific way. Bits which are marked 'reserved' or bits which are not in use have to be set to "0".

The structure of the PROFIdrive Safety status word 1 is shown in Table 5.

**Table 5: Overview on the assignment of the bits of Safety status word 1**

Byte	Bit	Name	Significance
0	0	POWER_REMOVED	Safe Torque Off active / Safe Torque Off inactive (one-active)
0	1	SS1_ACTIVE	Safe Stop 1 active / Safe Stop 1 inactive (one-active)
0	2	SS2_ACTIVE	Safe Stop 2 active / Safe Stop 2 inactive (one-active)
0	3	SOS_ACTIVE	Safe Operational Stop active / Safe Operational Stop inactive (one-active)
0	4	SLS_ACTIVE	Safe Limited Speed active / Safe Limited Speed inactive (one-active)
0	5	SLT_ACTIVE	Safe Limited Torque active / Safe Limited Torque inactive(one-active)
0	6	SLP_ACTIVE	Safe Limited Position active / Safe Limited Positon inactive(one-active)
0	7	INTERNAL_EVENT	Safety Fault present / No Safety Fault
1	0 to 7	-	Device-specific

Explanation: The significance for bit value = 1 is to the left of the slash; bit value = 0 to the right.

### 5.2.4. Safety status word 2 (S\_ZSW2)

Different states of autonomous safety drive functions will be reported by different bits in the PROFIdrive Safety status word 2. An autonomous safety drive function to be used in an application has to be enabled explicitly in the drive by use of parameterization. The user data length of the „PROFIdrive Safety status word 2“ is 4 bytes. The meaning of the bits 0 to 23 will be defined in this profile. The bits 24 to 31 may be used in a manufacturer specific way. Bits which are marked 'reserved' or bits which are not in use have to be set to "0".

The structure of the PROFIdrive Safety status word 2 is shown in Table 7.

**Table 7: Overview on the assignment of the bits of Safety status word 2**

Byte	Bit	Name	Significance
0	0	POWER_REMOVED	Safe Torque Off active / Safe Torque Off inactive (one-active)
0	1	SS1_ACTIVE	Safe Stop 1 active / Safe Stop 1 inactive (one-active)
0	2	SS2_ACTIVE	Safe Stop 2 active / Safe Stop 2 inactive (one-active)
0	3	SOS_ACTIVE	Safe Operational Stop active / Safe Operational Stop inactive (one-active)
0	4	SLS_ACTIVE	Safe Limited Speed active / Safe Limited Speed inactive (one-active)
0	5	SLT_ACTIVE	Safe Limited Torque active / Safe Limited Torque inactive (one-active)
0	6	SLP_ACTIVE	Safe Limited Position active / Safe Limited Position inactive (one-active)
0	7	INTERNAL_EVENT	Safety Fault present / No Safety Fault
1	0	-	Reserved for future use
1	1	SLS_LIMIT_BIT0_ACTIVE	Bit 0 of selected SLS speed limit value
1	2	SLS_LIMIT_BIT1_ACTIVE	Bit 1 of selected SLS speed limit value
1	3	-	Reserved for future use
1	4	SDI_P_ACTIVE	Safe Direction Positive active / Safe Direction Positive inactive, only positive speed (on-active)
1	5	SDI_N_ACTIVE	Safe Direction Negative active / Safe Direction Negative inactive, only negative speed (on-active)
1	6	-	Reserved for future use
1	7	SSM	Speed below limit value / Speed equal or above limit value
2	0	SLT_LIMIT_BIT0_ACTIVE	Bit 0 of selected SLT torque limit value
2	1	SLT_LIMIT_BIT1_ACTIVE	Bit 1 of selected SLT torque limit value
2	2	-	Reserved for future use
2	3	SLP_LIMIT_BIT0_ACTIVE	Bit 0 of selected SLP Position limit value set
2	4	SLP_LIMIT_BIT1_ACTIVE	Bit 1 of selected SLP Position limit value set
2	5	-	Reserved for future use
2	6	SP_VALID	Safe Position in S_XISTx is valid / Safe Position in S_XISTx is not valid
2	7	SP_REF	Safe Position in S_XISTx is referenced / Safe Position in S_XISTx is not referenced

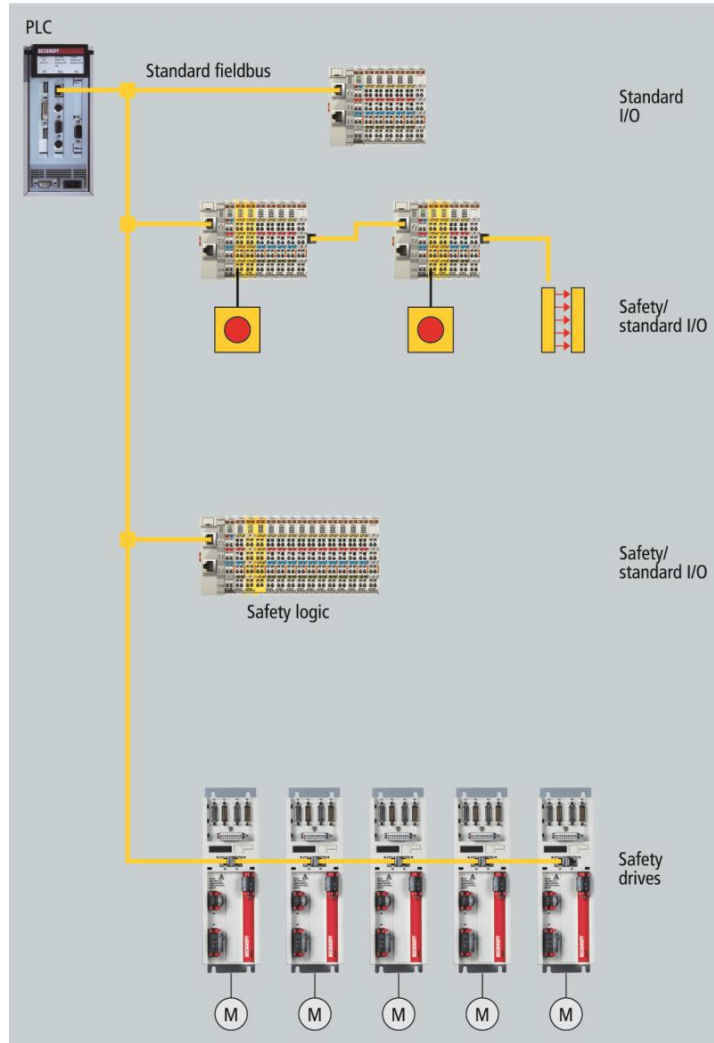

Byte	Bit	Name	Significance
3	0 to 7	-	Device-specific

Explanation: The significance for bit value = 1 is to the left of the slash; bit value = 0 to the right.

[Note from PLCopen: In Safety Status Word 1 & 2 the bit SS1\_ACTIVE reflects that the activity safe stop is active, which does not have to mean that the drive reached the safe torque off. This is also valid for SS2\_ACTIVE and safe stop reached. This means that the input for SF\_SafetyRequest can be assembled form: S\_Axis2SS1\_fdbk := SS1\_Active AND Power Removed]

### 5.3. Safety over EtherCAT

(Note: the table references are to the original document)

**Table 3: Safety controlword: 1st byte**

Bit	Name	Description
0	STO	Safe Torque Off 0: activate 1: deactivate
1	SS1_1	Safe Stop 1, Instance 1 0: activate 1: deactivate
2	SS2_1	Safe Stop 2, Instance 1 0: activate 1: deactivate
3	SOS_1	Safe Operating Stop, Instance 1 0: activate 1: deactivate
4	SSR_1	Safe Speed Range, Instance 1 0: activate 1: deactivate
5	SDIp	Safe Direction positive 0: disable positive direction 1: enable positive direction
6	SDIn	Safe Direction negative 0: disable negative direction 1: enable negative direction
7	Error Ack	Error Acknowledge 0: no acknowledge 0→1: Acknowledge of an error in the drive

**Table 5: Safety statusword, 1st byte (fix meaning)**

Bit	Name	Description
0	STO active	Safe Torque off 0: is not active 1: is active
1	SSM_1	Safe Speed Monitor 1, Instance 1 0: the drive is moving faster than the limit n_UL_SSM_1 1: the drive is moving slower or equal than the limit n_LL_SSM_1
2	SSM_2	Safe Speed Monitor 2, Instance 2 0: the drive is moving faster than the limit n_UL_SSM_2 1: the drive is moving slower or equal than the limit n_LL_SSM_2
3	SOS_1 active	Safe Operating Stop, Instance 1 0: is not active 1: is active
4	SSR_1 active	Safe Speed Range, Instance 1 0: is not active 1: is active and speed of the drive is within the safe speed range
5	SDIp active	Safe Direction positive 0: Drive does not move in positive direction 1: Drive moves in positive direction
6	SDIn active	Safe Direction negative 0: Drive does not move in negative direction 1: Drive moves in negative direction
7	Error	Error 0: no Error 1: at least one safety error has occurred

## 5.4. OpenSafety

Basic Set:

Control	Description	Status	Bit
Reset	Reset	Not error function	0
Activate	Activate	Operational	1
STO	Safe Torque Off	STO	2
SBC	Safe Brake Control	SBC	3
SS1	Safe Stop 1	SS1	4
Reserved		Reserved	5
Vendor specific		Vendor specific	6
Vendor specific		Vendor specific	7

Speed Extensions:

Control	Description	Status	Bit
SOS	Safe Operating Stop	SOS	0
SS2	Safe Stop 2	SS2	1
SLA	Safely Limited Acceleration	SLA	2
SLS-1	Safely Limited Speed 1	SLS-1	3
SLS2	Safely Limited Speed 2	SLS-2	4
Reserved		Reserved	5
Vendor specific		Vendor specific	6
Vendor specific		Vendor specific	7

Advance Extension:

Control	Description	Status	Bit
SDI-P	Safe Direction Positive	SDI-P	0
SDI-N	Safe Direction Negative	SDI-N	1
SLI	Safely Limited Increment	SLI	2
SBT	Safe Brake Test	SBT	3
Reserved		SBT is valid	4
SLT	Safely Limited Torque	SLT	5
Vendor specific		Vendor specific	6

Vendor specific		Vendor specific	7
-----------------	--	-----------------	---

Encoder Basic Set:

Control	Description	Status	Bit
Reserved	Encoder Status	Encoder Status	0
Homing	Homing	Homing	1
RefSwitch	Reference Switch	ReqHomingOK	2
SLP	Safely Limited Position	SLP	3
Reserved		Reserved	4
Reserved		Reserved	5
Vendor specific		Vendor specific	6
Vendor specific		Vendor specific	7

## 5.5. CIP Safety over Sercos

Definitions of Control-bits

Input combination	Value	SafeMotion-Description	Function
EmergencyStopSignal	0	SMES	Safe Motion Emergency Stop
EmergencyStopSignal	1	SMSS1	Safe Motion Safe Stop 1 <sup>1</sup>
Enabling Control	0	SMSS2	Safe Motion Safe Stop 2 <sup>1</sup>
ModeSelectionSignal	0		
EmergencyStopSignal	1	None	Safe Motion deaktiviert
Enabling Control	1		
ModeSelectionSignal	1		
EmergencyStopSignal	1	SMMx	Safe Motion Mode 1 <sup>2</sup>
Enabling Control	1		
ModeSelectionSignal	0		
SMMx	1		

Possible Conventions for a SMM:

Abbreviation	SafeMotion Monitoring function
SLS	Safe Limited Speed
SDI	Safe Direction
SLI	Safely Limited Increment
SLT	Safely Limited Torque
SLP	Safely Limited Position
SSM	Safe Speed Monitor
SCA	Safe CAM

## 5.6. CC-Link IE

### Safety Communication

### Safety PDU structure

The structure of the CC-Link IE Safety PDU (Protocol Data Unit) is shown in Figure 19: Safety PDU structure. S-Data in the PDU contains the safety input data or the safety output data. The size of S-Data area is 1..16 octet length.

Figure 19: Safety PDU structure

Name, size, and contents of the elements contained in the safety PDU are shown in Table 1.

**Table 1 Element of safety PDU**

Name	Size	Description	
S-Header	96 bits	Safety Protocol Information	
	CTRL	32 bits	Command type, state etc.
	CID	32 bits	Connection ID
	TS	16 bits	Time stamp
OBL	16 bits	Offset baseline	
S-Data	1..16 octet	Safety data	
CRC32	32 bits	32 bit CRC for safety communication	

### S-Data

S-Data is used to store safety data.

The structure of S-Data for safety refresh is shown in Figure 20: Structure of S-Data for safety refresh.

Figure 20: Structure of S-Data for safety refresh

### Safety control word

The Safety data which are sent from Master to Slave are based on Safety control word shown below.

Table 2: Safety controlword 1

Bit	Name	Description
0	STO	Safe Torque Off 0: activate 1: deactivate
1	SS1_1	Safe Stop 1, Instance 1 0: activate 1: deactivate
2	SS2_1	Safe Stop 2, Instance 1 0: activate 1: deactivate
3	SOS_1	Safe Operating Stop, Instance 1 0: activate 1: deactivate
4	SSR_1	Safe Speed Range, Instance 1 0: activate 1: deactivate
5	SDIp	Safe Direction positive 0: activate positive direction 1: deactivate positive direction
6	SDIn	Safe Direction negative 0: activate negative direction 1: deactivate negative direction
7	Error Ack	Error Acknowledge 0: no acknowledge 0→1: Acknowledge of an error in the drive

Table 3: Safety controlword 2

Bit	Name	Description
0	Manufacturer Specific	0: activate 1: deactivate

### Safety status word

The Safety data which are sent from Master to Slave are based on Safety status word shown below.

Slave→Master

Table 4: Safety statusword 1

Bit	Name	Description	
0	STO active	Safe Torque Off	0: is not active 1: is active
1	SSM_1	Safe Speed Monitor, Instance 1	0: the drive is moving faster than the limit 1: the drive is moving slower or equal than the limit
2	SSM_2	Safe Speed Monitor, Instance 2	0: the drive is moving faster than the limit 1: the drive is moving slower or equal than the limit
3	SOS_1 active	Safe Operating Stop, Instance 1	0: is not active 1: is active
4	SSR_1 active	Safe Speed Range, Instance 1	0: is not active 1: is active
5	SDIp active	Safe Direction positive	0: Drive does not move in positive direction 1: Drive moves in positive direction
6	SDIn active	Safe Direction negative	0: Drive does not move in negative direction 1: Drive moves in negative direction
7	Error	Error	0: no error 1: at least one safety error has occurred

Table 5: Safety statusword 2

Bit	Name	Description
0	Manufacturer Specific	0: is not active 1: is active

## 5.7. MECHATROLINK

### MECHATROLINK Safety System

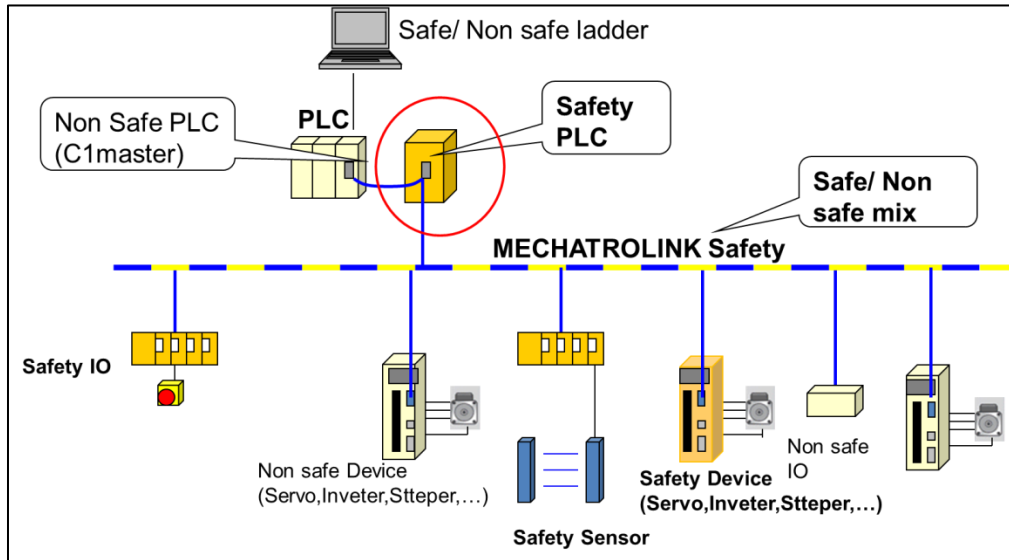

Figure 21: MECHATROLINK Safety System Structure

### MECHATROLINK Safety System Structure

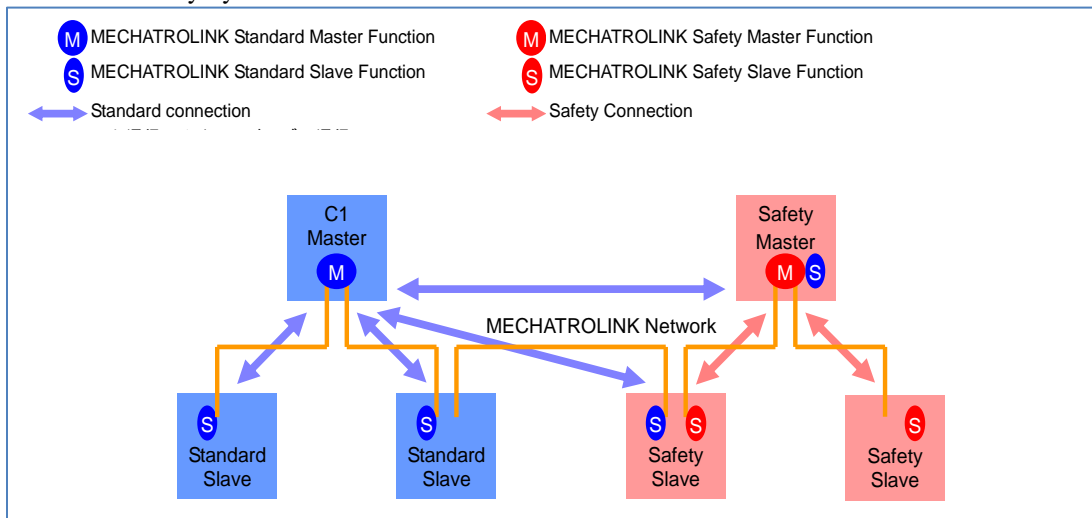

Figure 22: MECHATROLINK Safety System Structure Example

**MECHATROLINK Safety PDU format**

Figure 23: MECHATROLINK Safety System Safety PDU structure shows the safety PDU format. The Safe PDU is stored in an information section PDU part.

The PDU format is a structure that two or more blocks of 16 bytes or 32 bytes can be connected according to the communicated safety data size. The block of 50 pieces can be connected in the maximum.

Set the safety data size by "Request to set parameters" (S\_PRM\_SET) of the safety command.

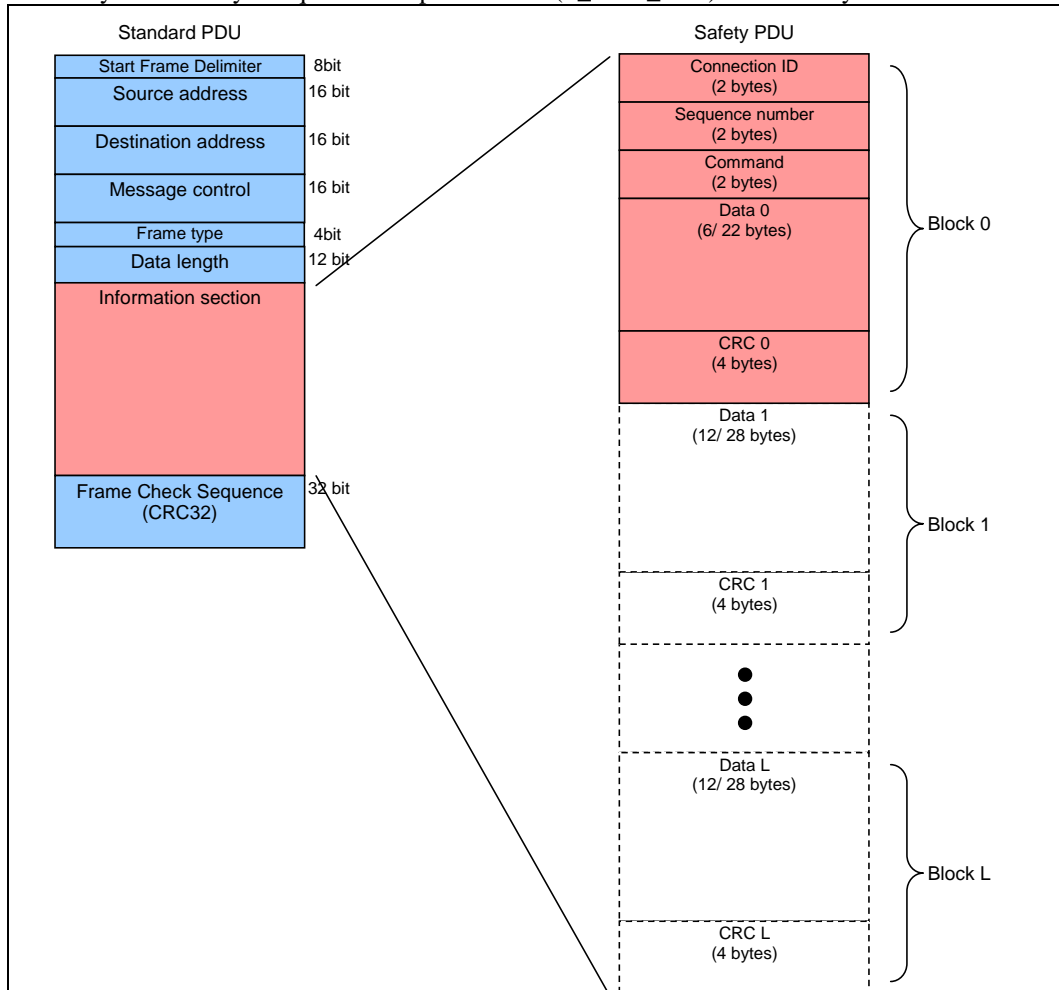

Figure 23: MECHATROLINK Safety System Safety PDU structure

**MECHATROLINK Safety Control byte**

Figure 24: MECHATROLINK Safety Control byte shows the structure of the MECHATROLINK Safety control byte. Send and receive the safety control byte by safety data transmission request (S\_SAFE\_DATA) of the safety command.

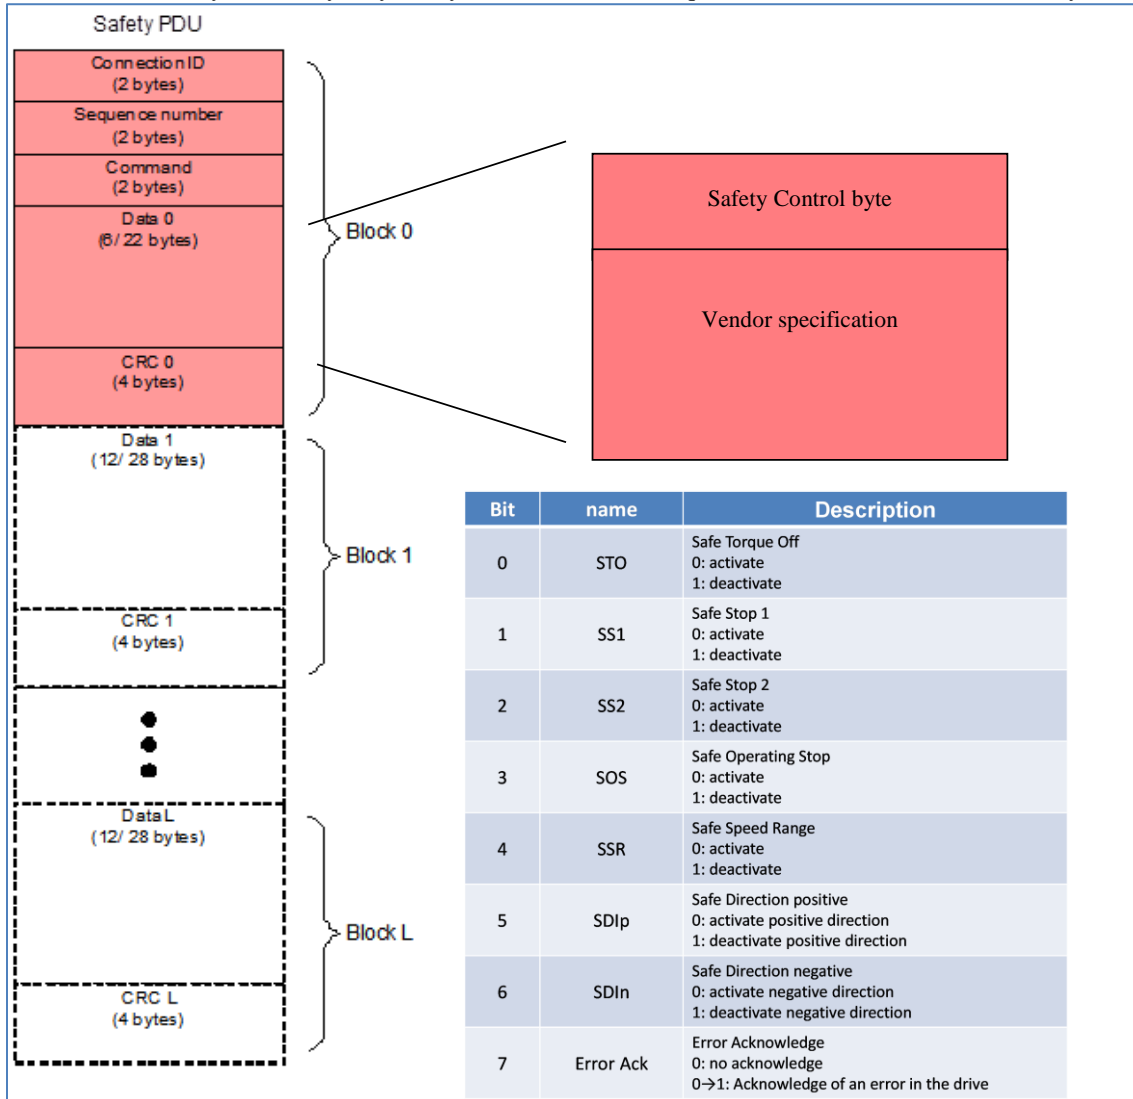

Figure 24: MECHATROLINK Safety Control byte

### MECHATROLINK Safety Status byte

Figure 25: MECHATROLINK Safety Status byte shows the structure of the MECHATROLINK Safety status byte. Send and receive the safety status byte by safety data transmission request (S\_SAFE\_DATA) of the safety command.

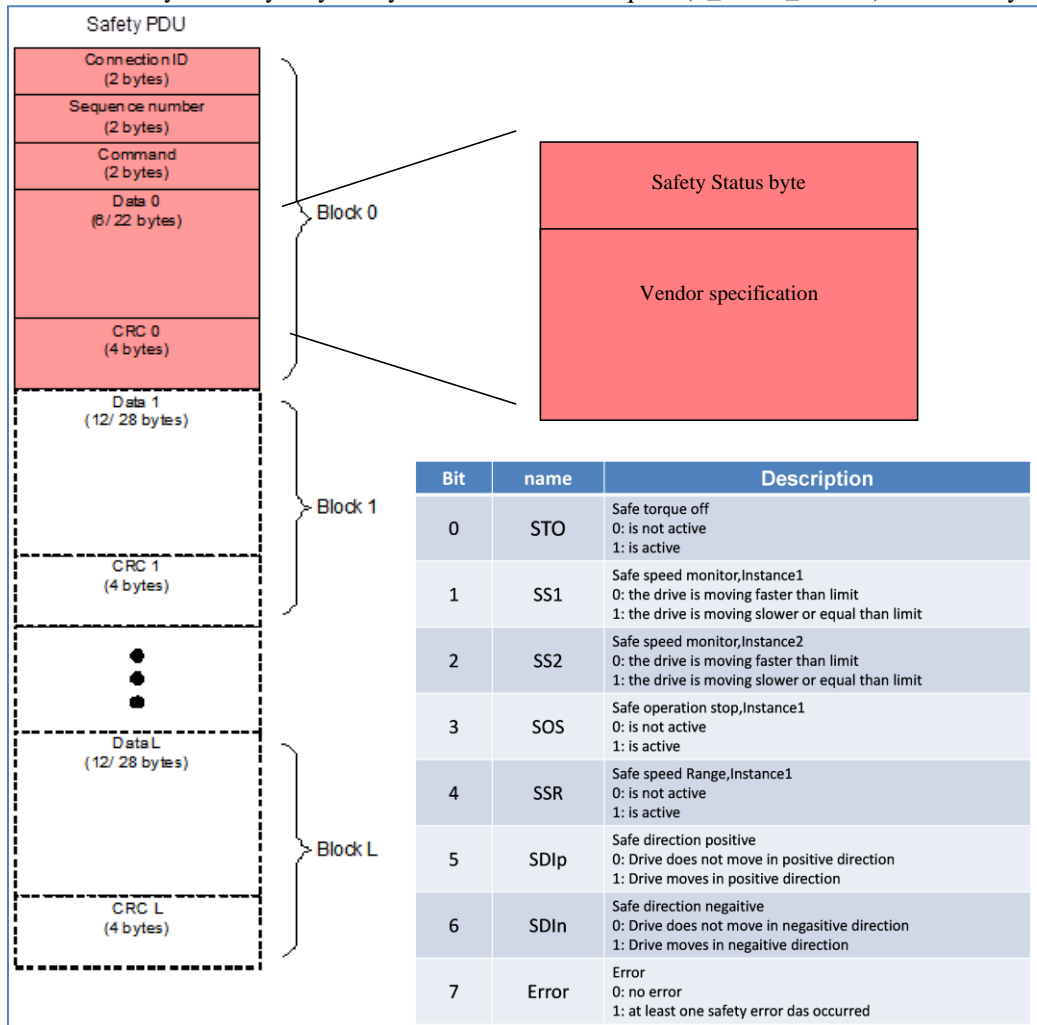

Figure 25: MECHATROLINK Safety Status byte

## MECHATROLINK Safety Command

Figure 26: MECHATROLINK Safety Command shows the structure of the MECHATROLINK Safety command.

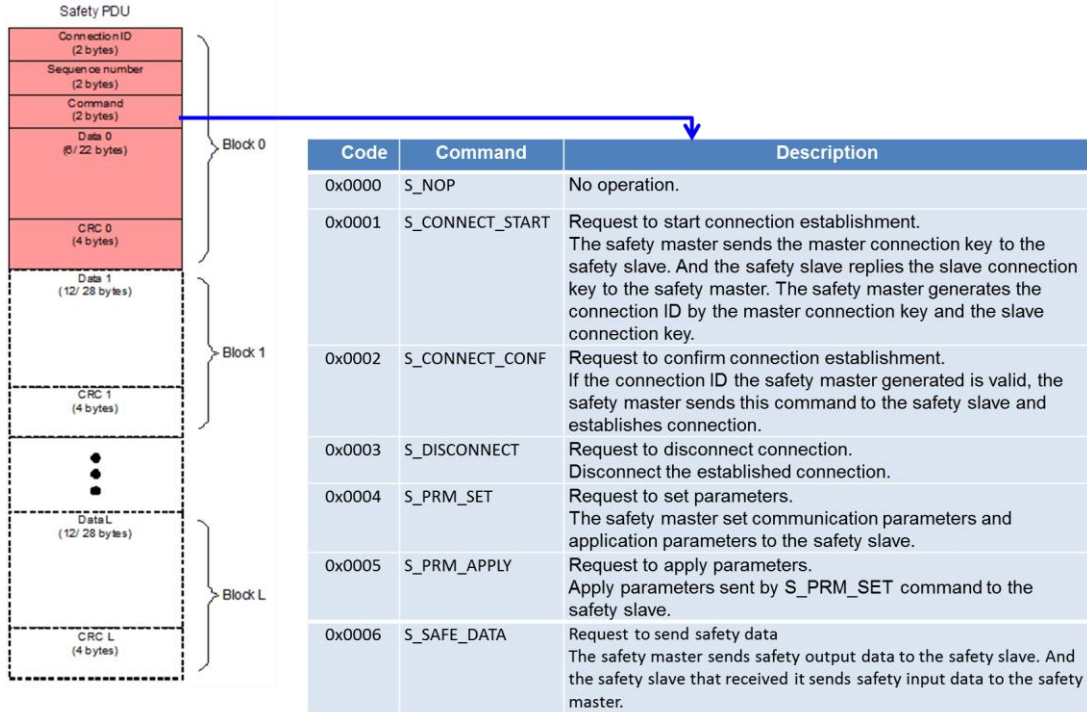

Figure 26: MECHATROLINK Safety Command

## 6 Mapping SF SafetyRequest to existing functionalities

The proposed mapping of SF\_SafetyRequest to SafeMotion related functionalities is very much in line with the mapping of the other safety related functionalities like shown hereunder for SF\_EmergencyStop, SF\_EDM and SF\_TwoHandControlTypeII and III. In Figure 27: Additional Safety Functionalities these functionalities are depicted in short form, while in Figure 28: these are represented with SF\_SafetyRequest. Shown are several instances of SF\_SafetyRequest for different drives (1 and 2) with a naming scheme for the drives and the safety functionalities.

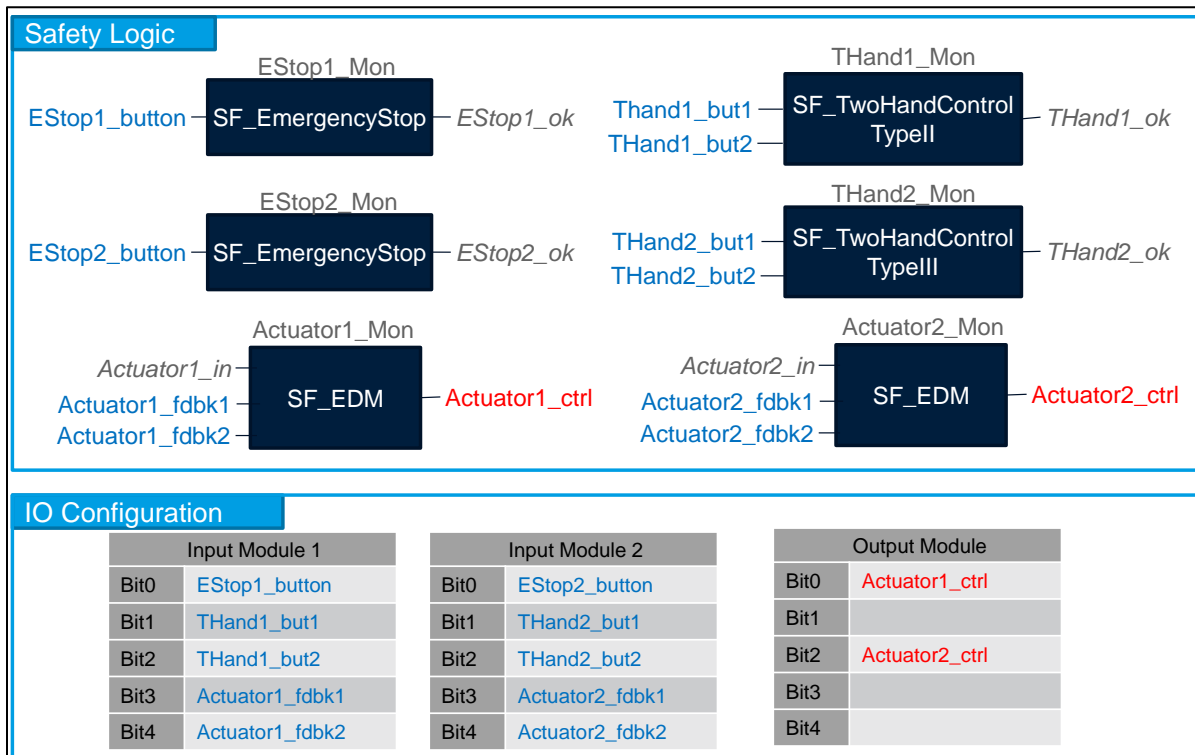

Figure 27: Additional Safety Functionalities

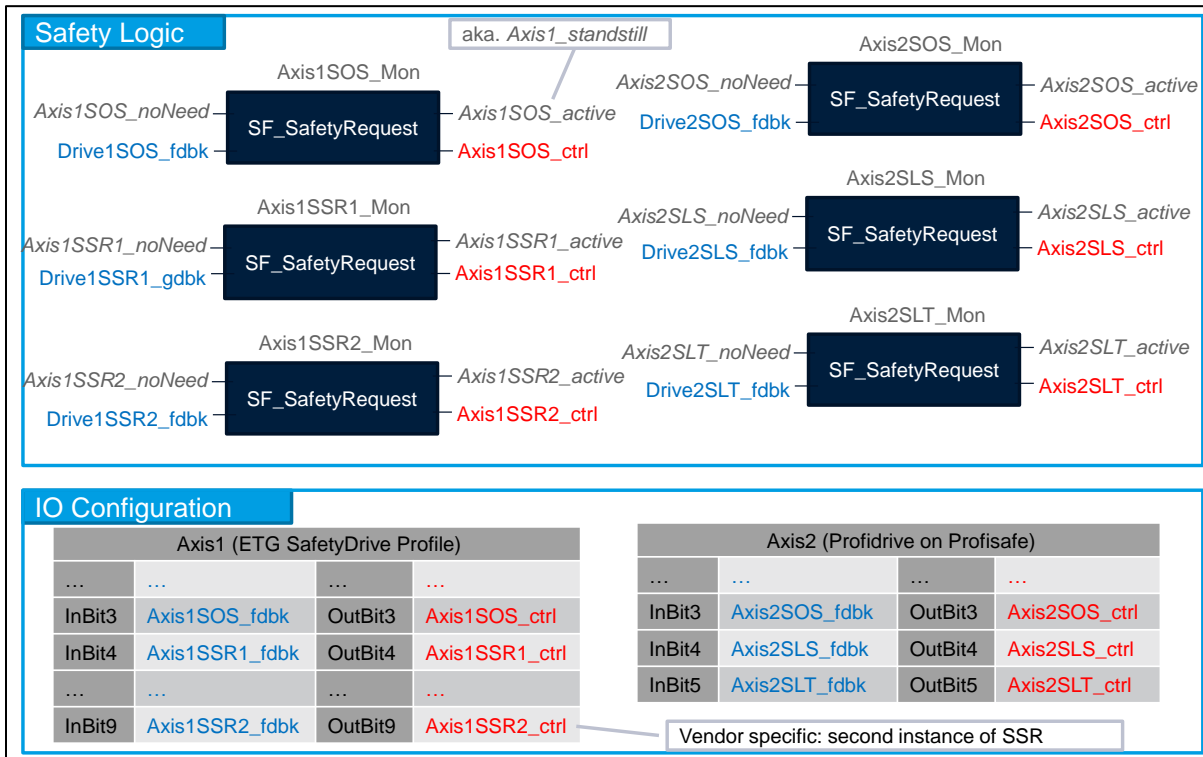

Figure 28: Mapping of these to SF\_SafetyRequest
